Foreword

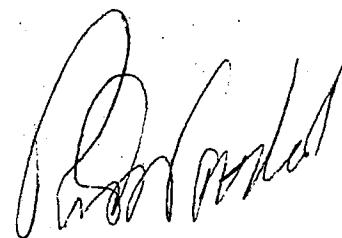

In 1989, the Department of Water Resources established the Municipal Water Quality Investigations Program. The Program unified the Department's drinking water quality studies in the Sacramento-San Joaquin Delta. The MWQI Program incorporated the project objectives of the Interagency Delta Health Aspects Monitoring Program, the Delta Island Drainage Investigation, and special studies to monitor bromide, sea water intrusion, and other water quality parameters affecting the use of the Sacramento-San Joaquin Delta waters as a drinking water source.

Department staff monitor and assess the major sources of water quality impacts in the Delta. Included are the Bay-Delta estuary, river inflows, drainages from land surfaces, the Delta channels, and weather-related events. 1.5

The Program's major goal is to assist water agencies in protecting and improving Delta drinking water supplies and to guide water treatment research. To achieve this, Program staff examine the major sources and causes of water quality changes in the Delta that affect drinking water quality. Key Delta channel and river stations and agricultural drains are monitored for trihalomethane formation potential, arsenic, copper, mercury, and different minerals. 2.

This report presents the findings from monitoring water quality changes in the Delta from October 1993 through September 1994. The 1994 water year was determined to be critically dry. 1.6

For further information on the Municipal Water Quality Investigations Program, contact Rick Woodard of the Division of Local Assistance, Department of Water Resources, at 1020 Ninth Street, Sacramento, CA 95814, or by phone at (916) 327-1636. Limited copies of this report can be obtained at no charge from the Division of Local Assistance by contacting Rose Luna at the above address, or by phone at (916) 327-1637.

I. EXECUTIVE SUMMARY

This report summarizes water quality data collected in the Sacramento-San Joaquin Delta under the Municipal Water Quality Investigations Program during the water year 1994. This period was critically dry (October 1993 - September 1994) following a water year that was above normal in precipitation (October 1992 - September 1993). Under the MWQI Program, major channel stations and agricultural drains were monitored on a monthly basis. Several times a year, synoptic surveys were also conducted where many stations were sampled in a three-day period with all channel stations being sampled on the same day. Autosamplers located at four stations collected samples seven days per week.

Water samples were analyzed for organic precursors to trihalomethanes, a disinfection by-product formed during water treatment. Disinfection by-products are becoming increasingly important to water treatment managers because of impending regulations. Water samples were also analyzed for standard minerals and selected sites were analyzed for trace metals.

These data are presented here in a noninterpretive data summary format. All of the data sampled during this one-year period are presented in Appendix B. Selected data from the major channel stations and from all of the agricultural drains and autosampler stations are presented in the body of the report in graphical form. This data summary will be followed by an interpretive report which will cover five years of water quality data (Water Years 1992 through 1996). This report will be published in January 1997.

Some major trends are evident in the data presented here. Effects of tidal influence, agricultural drainage, and seasonal precipitation are seen in the water quality results plotted over time. These trends will be further analyzed in subsequent interpretive reports.

II. PROGRAM DESCRIPTION

A. Purpose

The MWQI Program staff collect water quality data for numerous purposes. The data are used to:

- (1) Alert water agencies about potential contaminant sources to Delta water supplies;
- (2) Document water quality under a variety of hydrologic conditions for studying water transfer alternatives, water quality standards, and predictive modeling capabilities;
- (3) Determine the influence of sea water intrusion, local and external sources of farm drainage, river input, in-channel processes, weather, and State Water Project and Central Valley Project operations on Delta drinking water quality. Selenium, bromide, and other inorganic constituents are used to trace the movement and mixing of water from different sources; and
- (4) Assist the Department and other participating water agencies in planning, protecting, and improving drinking water quality.

B. Program Advisors

The MWQI Advisory Committee provides policy-level guidance and recommends program modifications as needed to respond to changing drinking water quality concerns. The Municipal Water Quality Investigations Advisory Committee provides specific expertise in laboratory methodologies, regulatory updates, and review of the analyses, interpretation, and reporting of program data. The Delta Lands Advisory Committee assists the Department with permission to sample agricultural drains and provides information about farming activities in the Delta. The Committees also review and comment on the program reports and give advice on program expenditures.

C. Monitoring Stations

The MWQI Program staff coordinate several monitoring tasks, including the monthly monitoring of key Delta stations, synoptic surveys to study sea water intrusion, Delta island drainage sampling, and special studies.

Water quality is a public health concern at water supply intakes in the Delta. Five stations that are monitored routinely include:

- (1) American River Water Treatment Plant intake that serves the City of Sacramento (Station 1);
- (2) North Bay Pumping Plant (Station 87) that serves Solano and Napa Counties;
- (3) Rock Slough at Old River (Station 9), 4 miles east of the Contra Costa Water District intake;
- (4) Harvey O. Banks Delta Pumping Plant Headworks (Station 12), which is the headworks of the California Aqueduct; and
- (5) Delta Mendota Canal Intake at Lindemann Road (Station 11), which is upstream of the Tracy Pumping Plant for the Delta-Mendota Canal.

In addition to these stations, other monitoring locations in the Delta provide information about the transport and mixing of Delta waters and enable a more comprehensive evaluation of water quality conditions.

Synoptic surveys were performed to trace the movement of water entering the State Water Project, the Central Valley Project, and Contra Costa Water District pumping facilities. The synoptic surveys took place over three-day periods at 30 channel stations and 42 drains. All channel stations, however, were sampled in one day. Five synoptic surveys were conducted during Water Year 1994. The synoptic survey data is not separated from the regular monthly sampling data for the purposes of this report. A separate interpretive report will be published in the future that will analyze the data of the synoptic surveys.

Autosamplers have been used since 1993 to study the daily variation of some water quality parameters. Samples were collected every 24 hours for electrical conductivity (EC), dissolved organic carbon (DOC), and ultraviolet absorbance at 254 nanometers (UVA_{254nm}). Autosamplers were installed at two agricultural drains (Twitchell Island and Mandeville Island) and two channel stations (Middle River at Borden Highway and Greene's Landing).

Type Code:

AD refers to an agricultural drain.

HF refers to a channel station. The H code referred to the Interagency Health Aspects Monitoring Program station and the F code stood for a freshwater sample type.

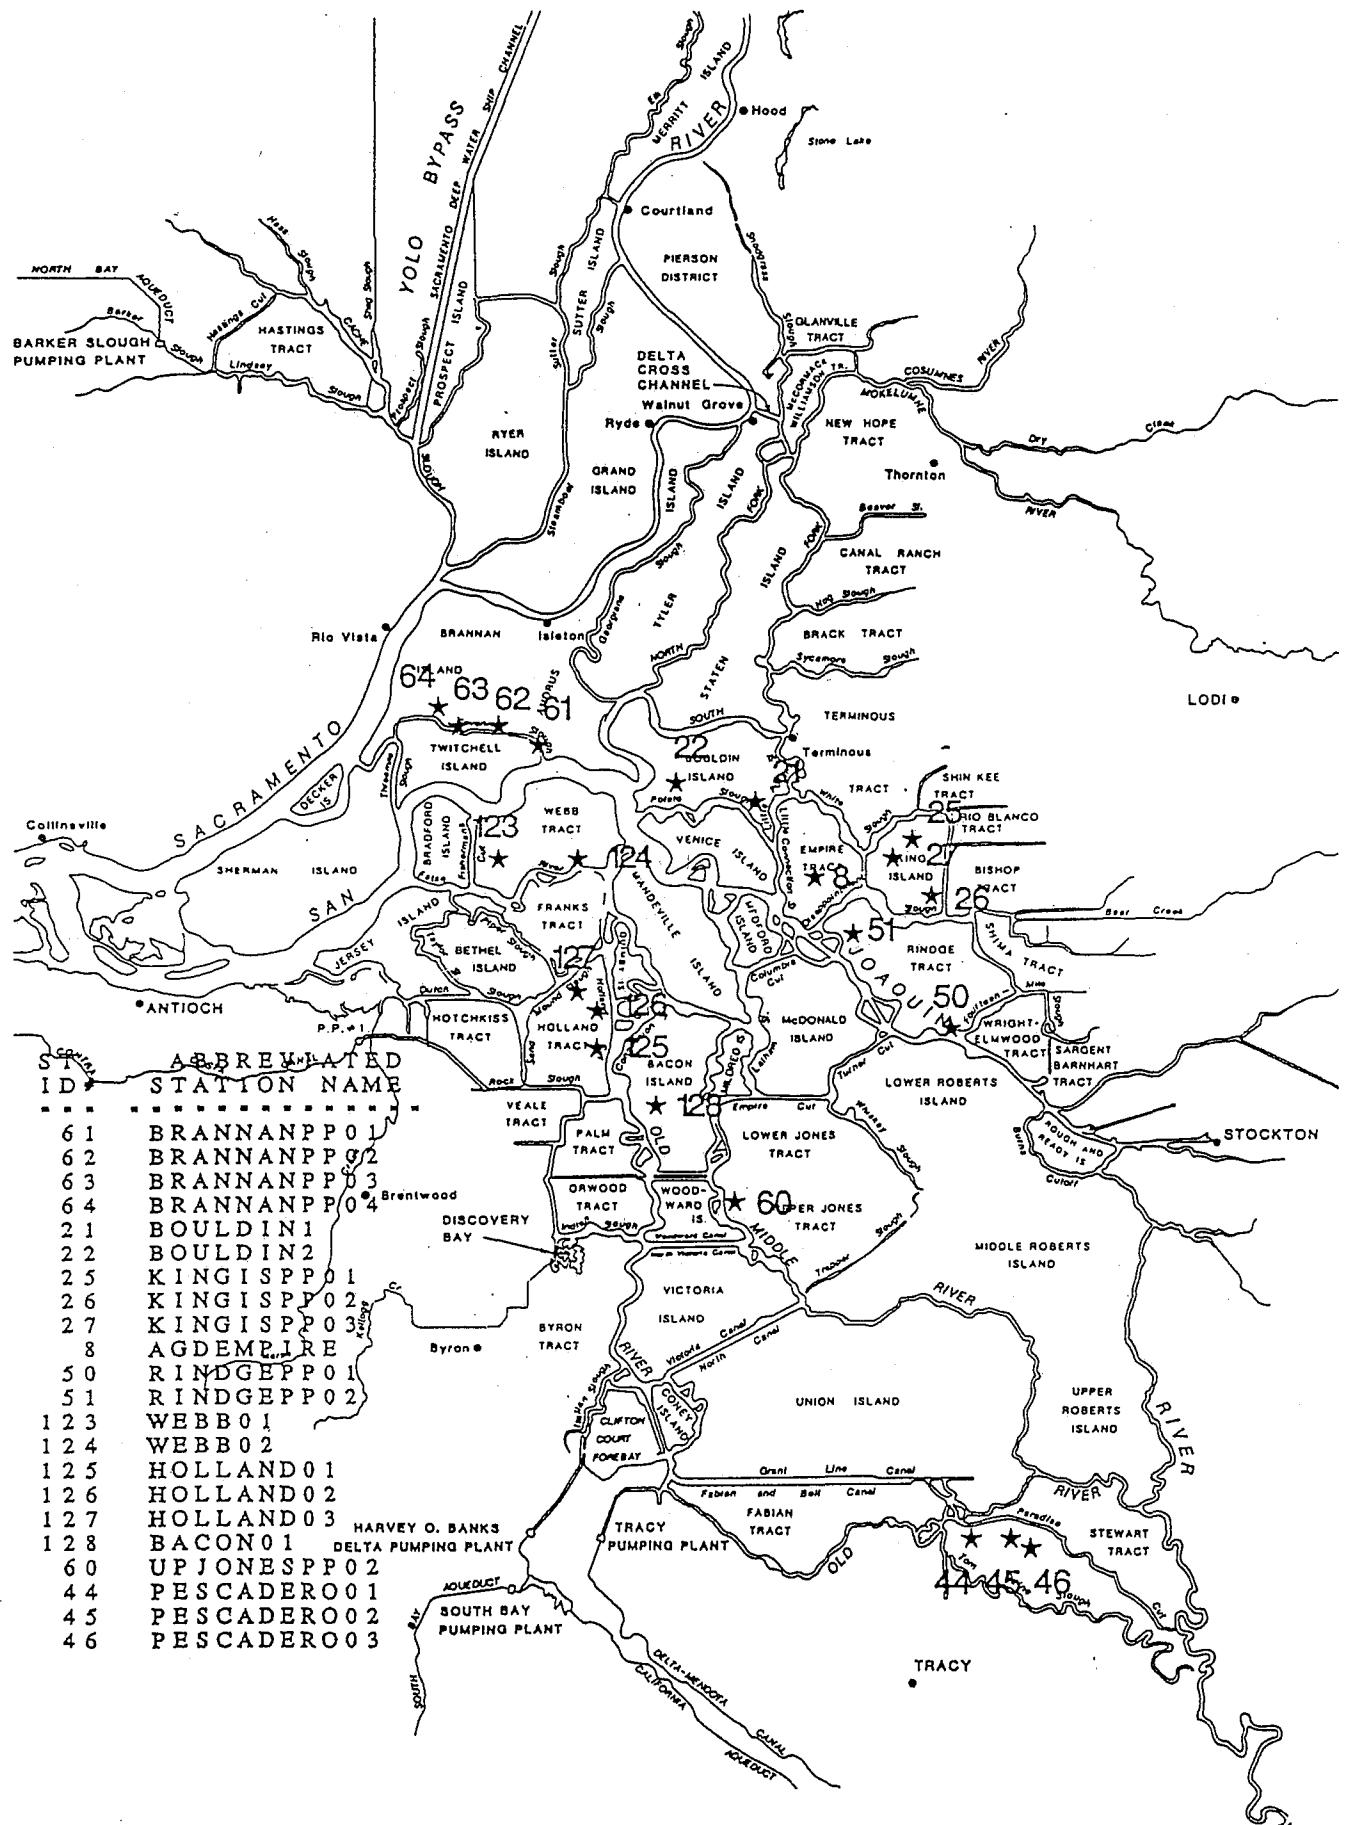

Figure 2. Monitored Agricultural Drainage Sampling Stations

D. Field Sampling Methods

Samples were collected in a specially designed stainless steel bucket developed by DWR. The sample bucket is equipped with two Teflon valves to dispense the collected water. Before the bucket was used, it was washed in detergent, rinsed in tap water, and air dried. For some analyses, the samples were filtered in the field with a 0.45 micrometer filter using a peristaltic pump with Teflon tubing.

A Yellow Springs Instrument (YSI) electrical conductivity/temperature meter was used to record EC and temperature. The Hellige colorimetric kit or a Beckman Model 10 portable pH meter was used to determine pH. Dissolved oxygen was measured with a Yellow Springs Instruments Model 50 meter. All electrical conductivity meters, pH meters and dissolved oxygen meters were calibrated before use on each data collection run.

Filtered samples for volatile organic analyses (VOA) were collected in 40-milliliter glass vials. Sample containers were completely filled to eliminate air space and air bubbles. The caps of the 40-milliliter vials were fitted with Teflon-coated septa, as specified by the U.S. Environmental Protection Agency. Samples were kept on ice, or refrigerated and delivered to the laboratory within 24 hours of collection.

Separate sample containers were collected for laboratory measurements of bromide and ultraviolet absorbance at 254 nanometers ($UVA_{254\text{ nm}}$).

At least one blind field duplicate was collected on each sampling run (usually one duplicate in seven to ten samples). The duplicates were submitted to the laboratories with the regular samples as a quality assurance check.

E. Analytical Methods

THMFP/TFPC Analysis

The total trihalomethane formation potential carbon (TFPC) results are computed by summing the amount of carbon in each of the four trihalomethane (THM) species in the DWR THMFP assay. The TFPC represents the amount of organic carbon that was converted to a trihalomethane under the DWR assay. This method allows comparison of raw water THM organic precursor levels to the anticipated THM levels after water treatment.

At the laboratory, water samples for THMFP analysis were chlorinated (inoculated) with about 120 mg/l chlorine. This high dosage was used to assure a chlorine residual after the seven-day incubation period at 25 degrees Celsius. At the end of seven days, the chlorine residual was determined. The residual chlorine was then quenched using sodium thiosulfate, and the sample was analyzed for trihalomethanes by the gas chromatograph purge and trap method, EPA Method 502.2. For a more complete

description of the modified THMFP analytical method, see the description of the modified THMFP assay on page 90 of *The Five-Year Report of the Municipal Water Quality Investigations Program 1987-1991* published by DWR. THM analyses were performed at the Clayton Environmental Laboratory (see Appendix A- Data Quality Review).

DWR's Bryte Chemical Laboratory performed mineral, trace element, and some organic analyses. Further detail about laboratory methods used by Bryte Laboratory may be found in Appendix A and in *The Five-Year Report of the Municipal Water Quality Investigations Program 1987-1991*.

III. MONITORING RESULTS

A. Delta Channels

1. Organic Constituents

Dissolved Organic Carbon

The results of DOC analyses at major channel stations in the North Delta are shown in Figure 3. At the Barker North Bay pumping plant, DOC concentrations ranged from 3.1 to 12.8 mg/l, whereas at the major Sacramento and American River stations, the DOC concentrations were less than 4 mg/l. There were peaks in DOC concentrations for all stations in January through March, probably due to winter storm runoff.

DOC concentrations at major channel stations in the South Delta are shown in Figure 4. These concentrations varied similarly over time and ranged from 2.2 to 6.7 mg/l. In general, the DOC concentrations were greater than those in the North Delta. As in the North Delta, there were peaks in DOC concentrations from January through March that was probably the result of seasonal storms. Somewhat lower level peaks in May-June probably represent typical summer agricultural drainage from the San Joaquin Valley and local agricultural drainage.

Trihalomethane Formation Potential

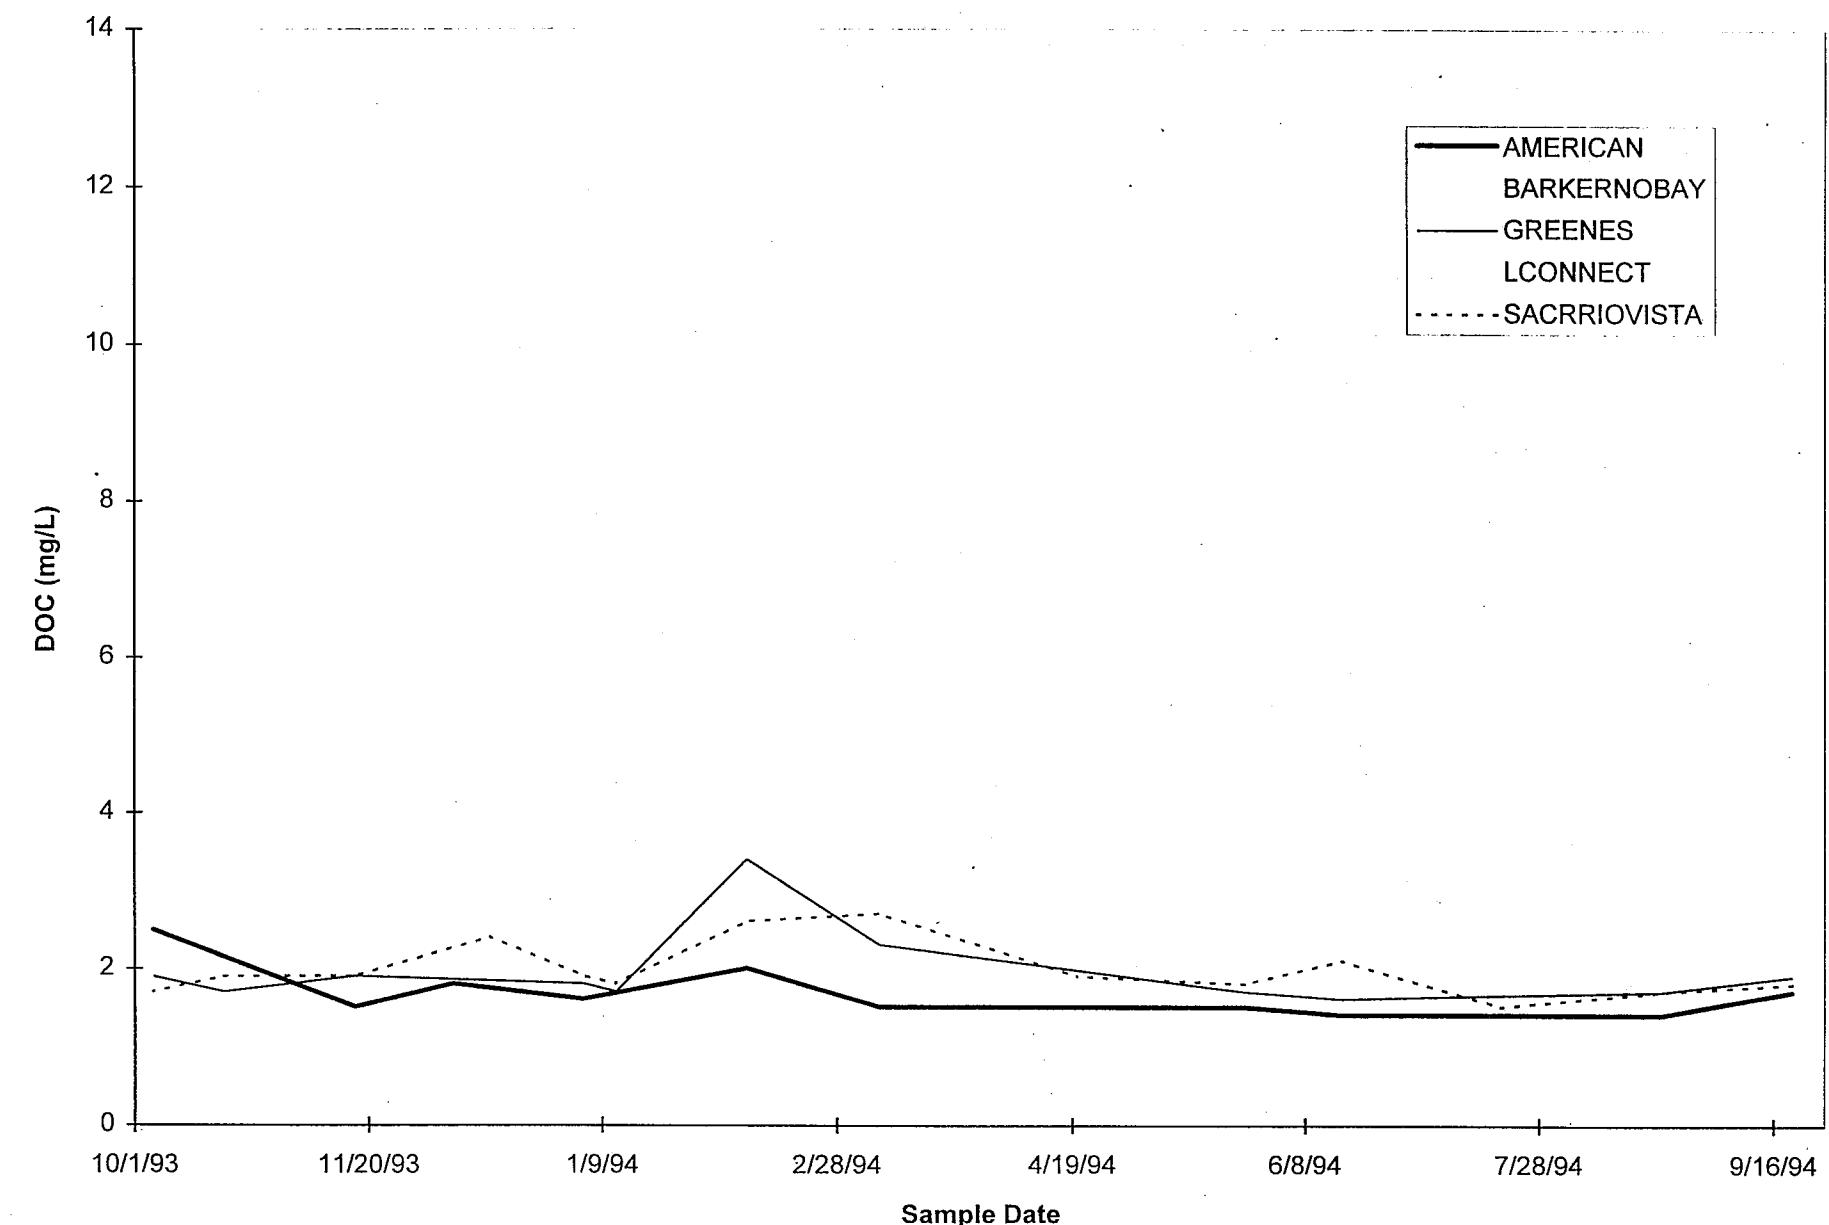

The results of THMFP analyses at major channel stations in the North Delta are shown in Figure 5. These concentrations vary similarly to the DOC concentrations in Figure 3. The concentrations range from 120 to 1400 ug/l with the concentrations at Barker North Bay pumping plant being greater than the other channel stations. There appears to be more agricultural runoff at Barker North Bay pumping plant than in the Sacramento River.

South Delta THMFP analyses results are shown in Figure 6. These THMFP concentrations are generally somewhat higher than those in the North Delta with less difference in values between the different stations. This close pattern of values at the South Delta stations implies that there are similar levels of precursor material and the water is relatively well mixed.

Total THM Formation Potential Carbon

Figures 7 and 8 show total trihalomethane formation potential as carbon for the North and South Delta, respectively. These figures show the same data as Figures 5 and 6, but in the units of TFPC. The range of TFPC for both regions is from 12 to 140 ug/l.

Figure 3: North Delta DOC Ranges (10/93-9/94)

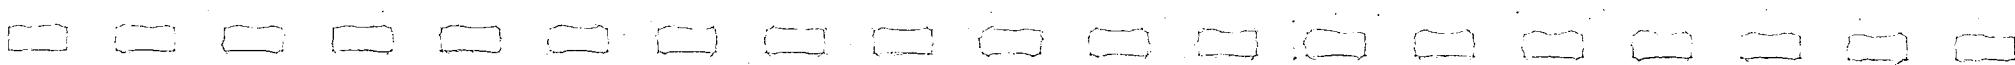

Figure 4: South Delta DOC Ranges (10/93-9/94)

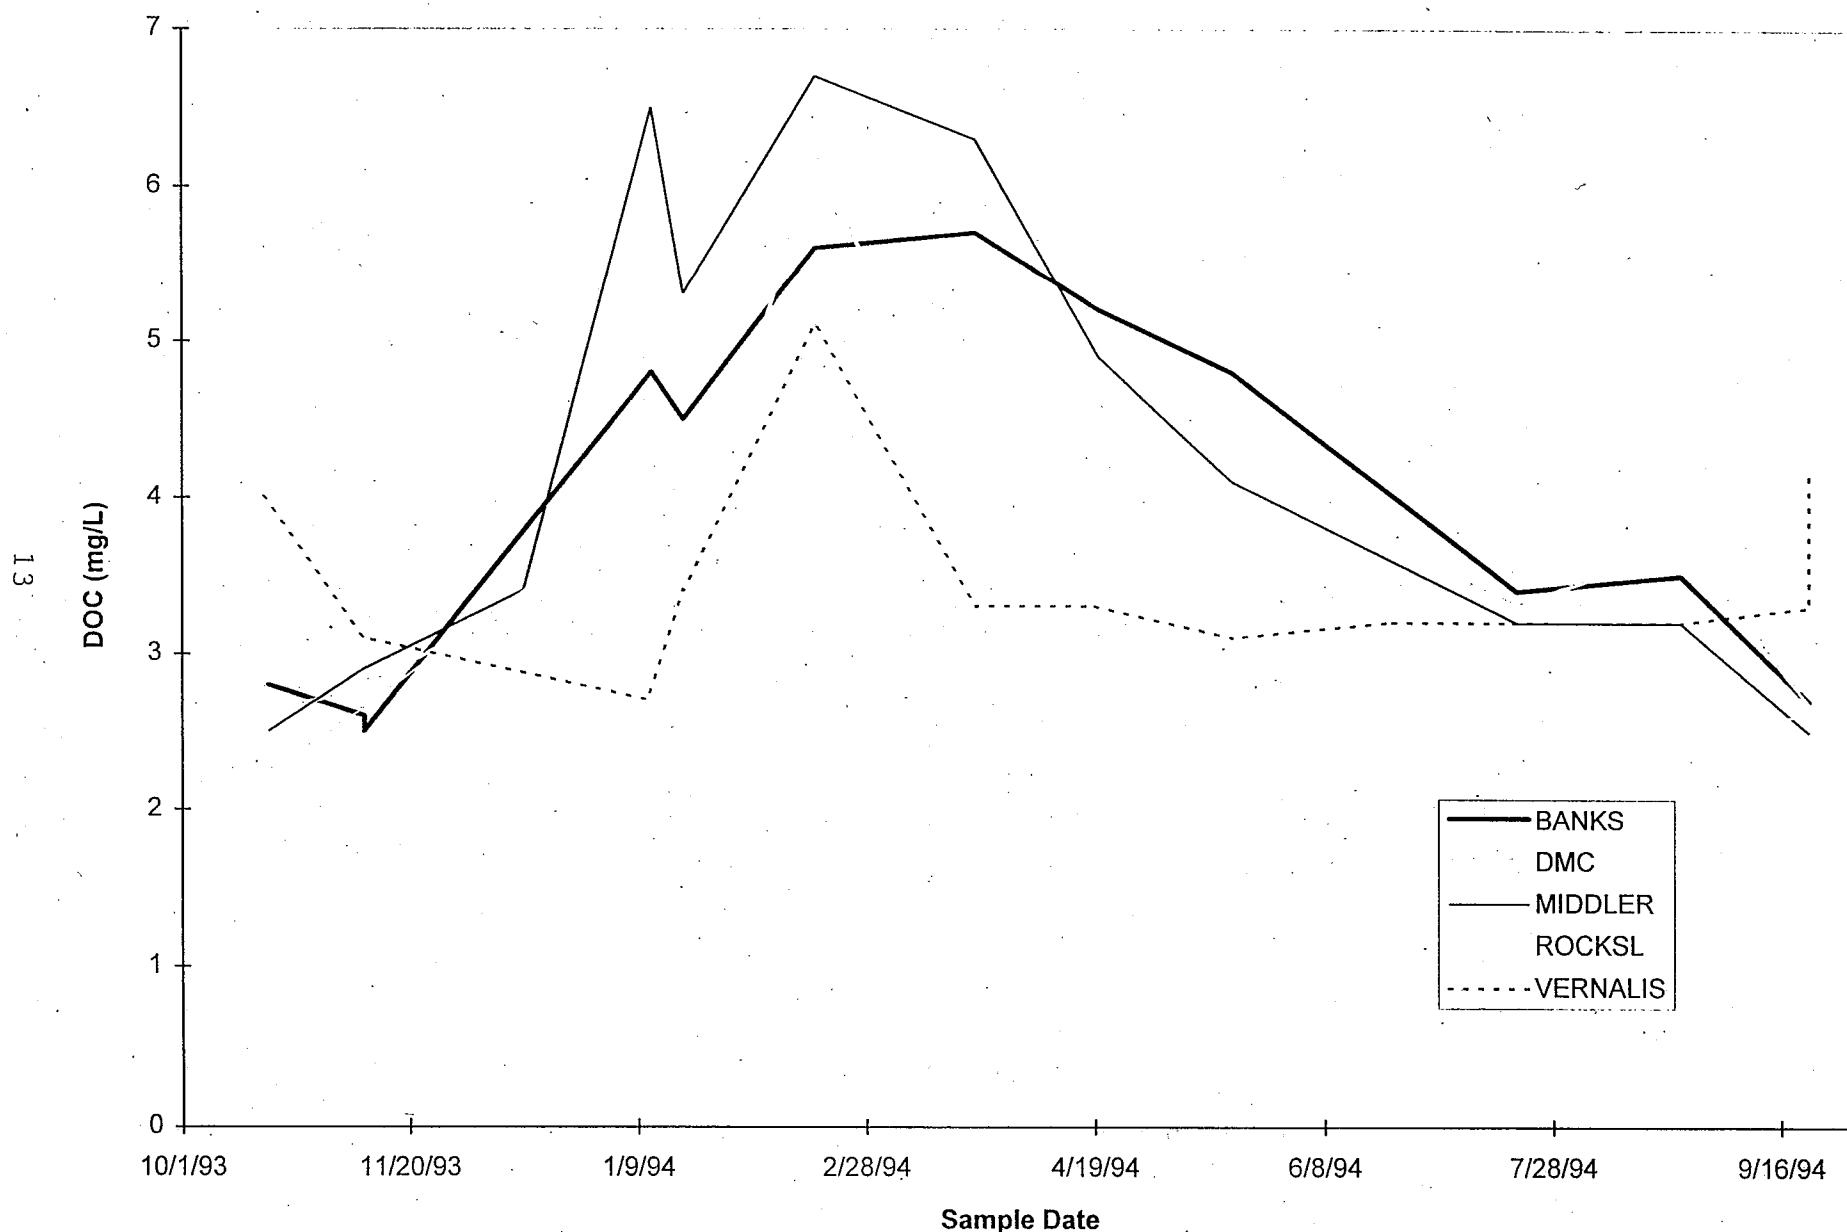

Figure 5: North Delta THMFP Ranges (10/93-9/94)

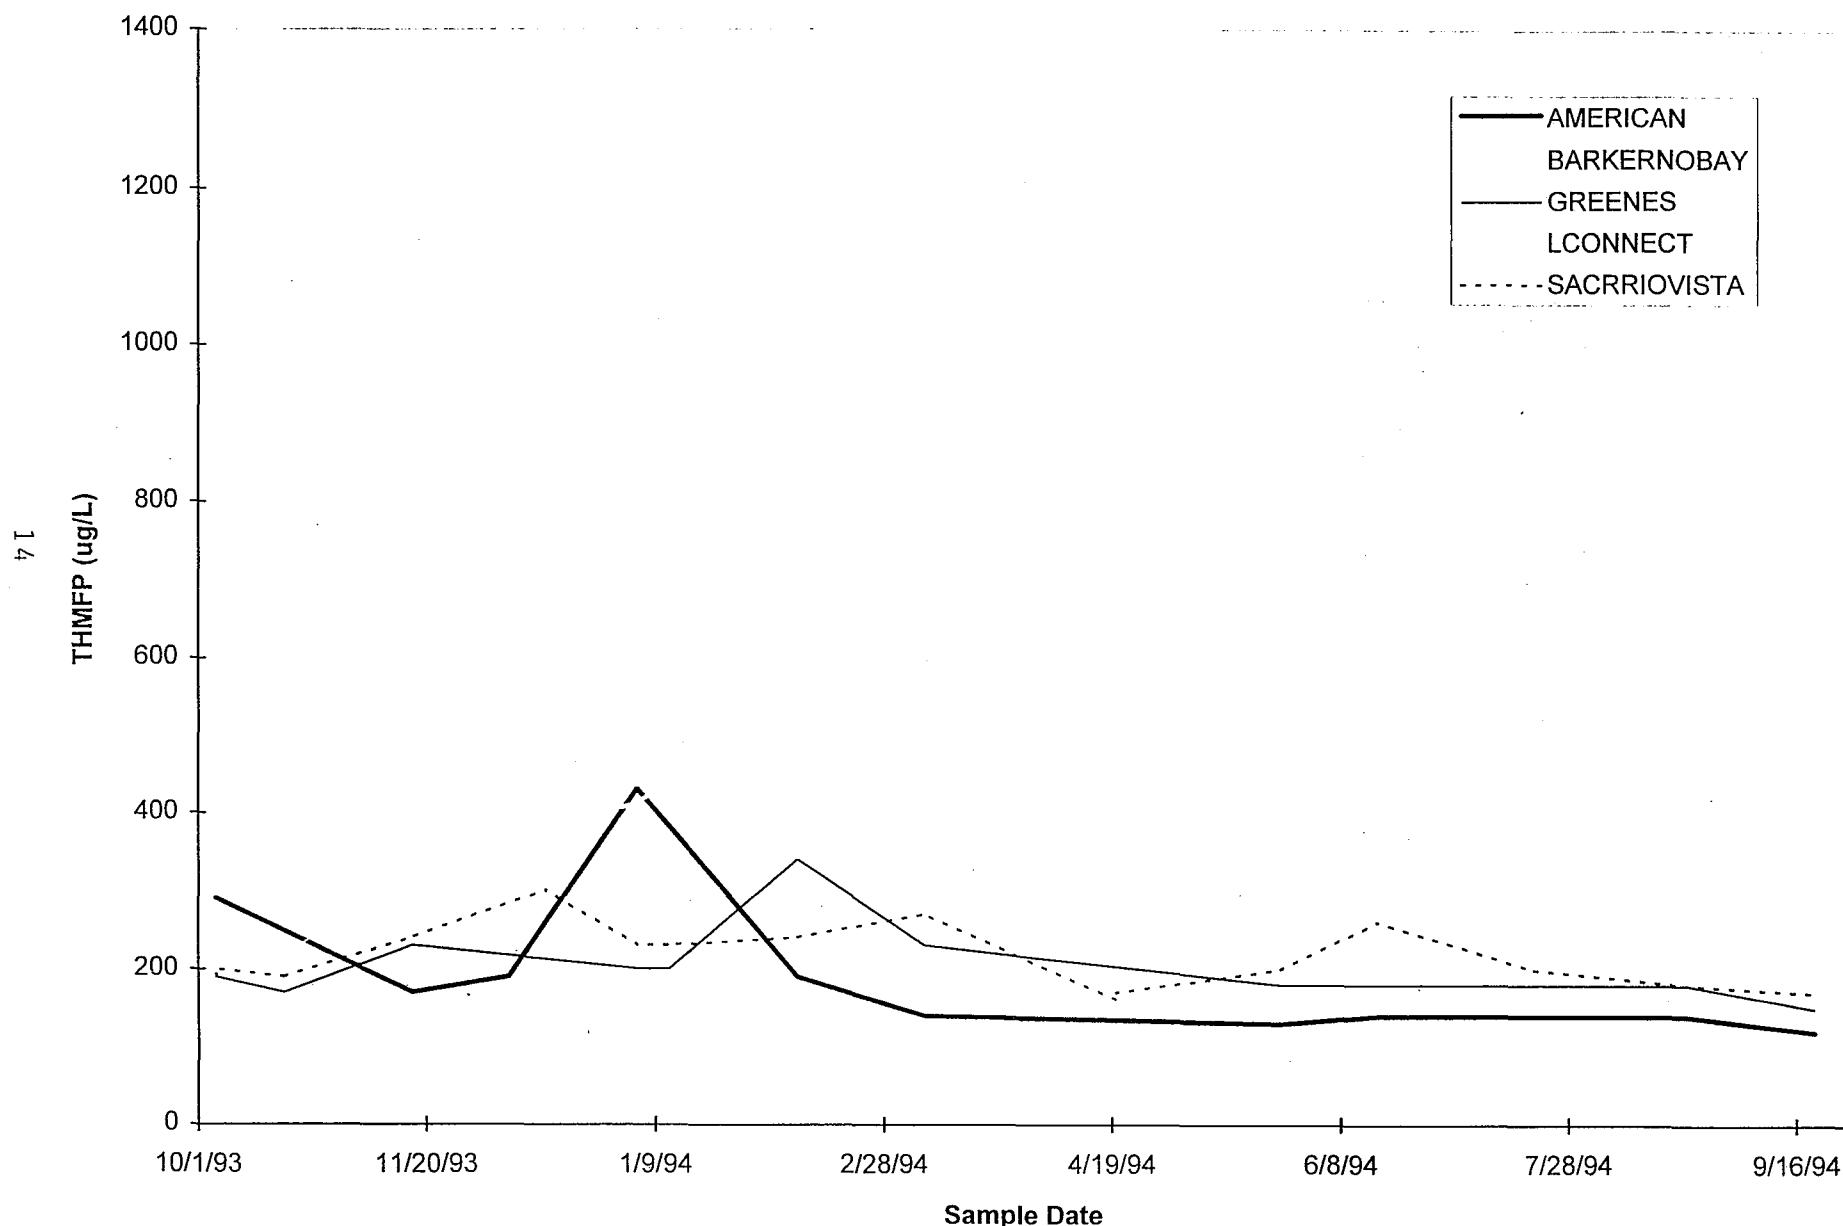

Figure 6: South Delta THMFP Ranges (10/93-9/94)

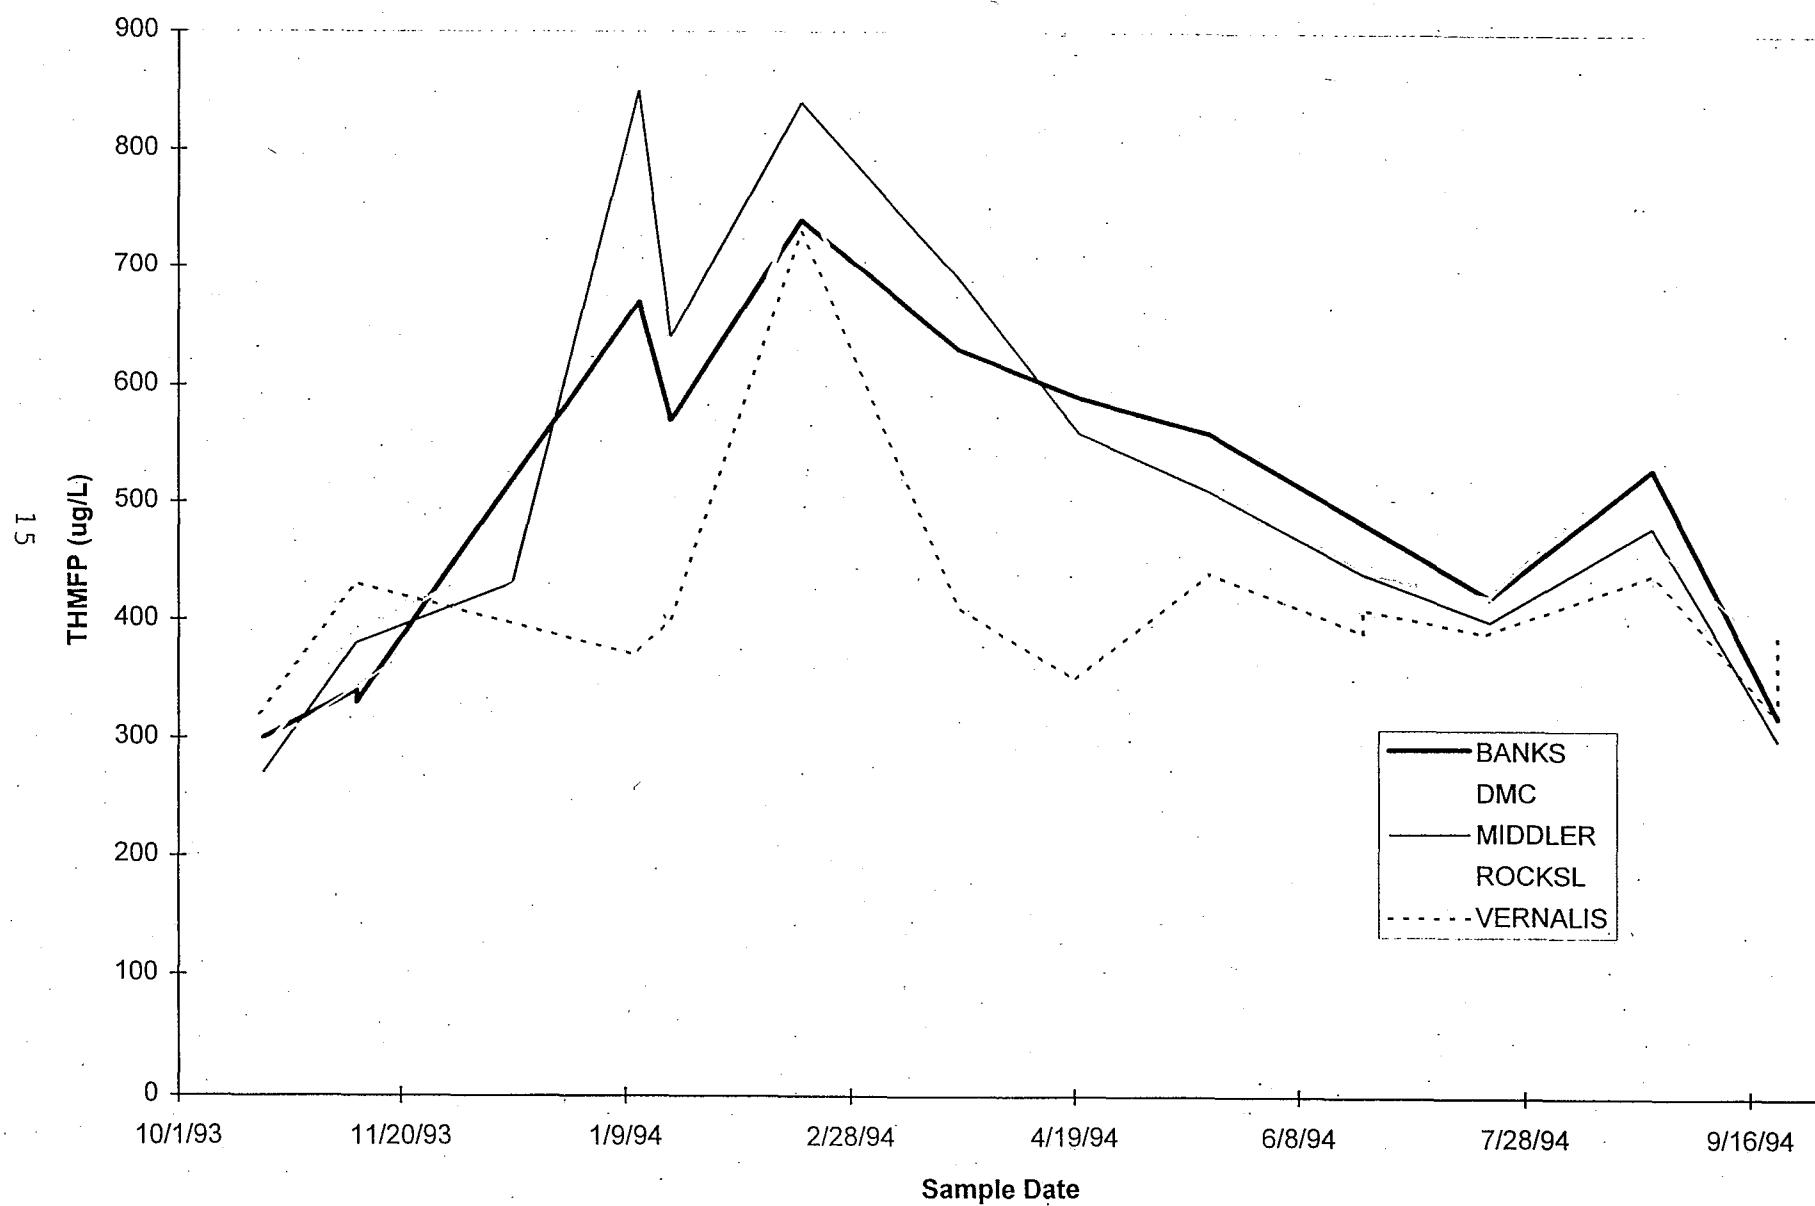

Figure 7: North Delta TFPC Ranges (10/93-9/94)

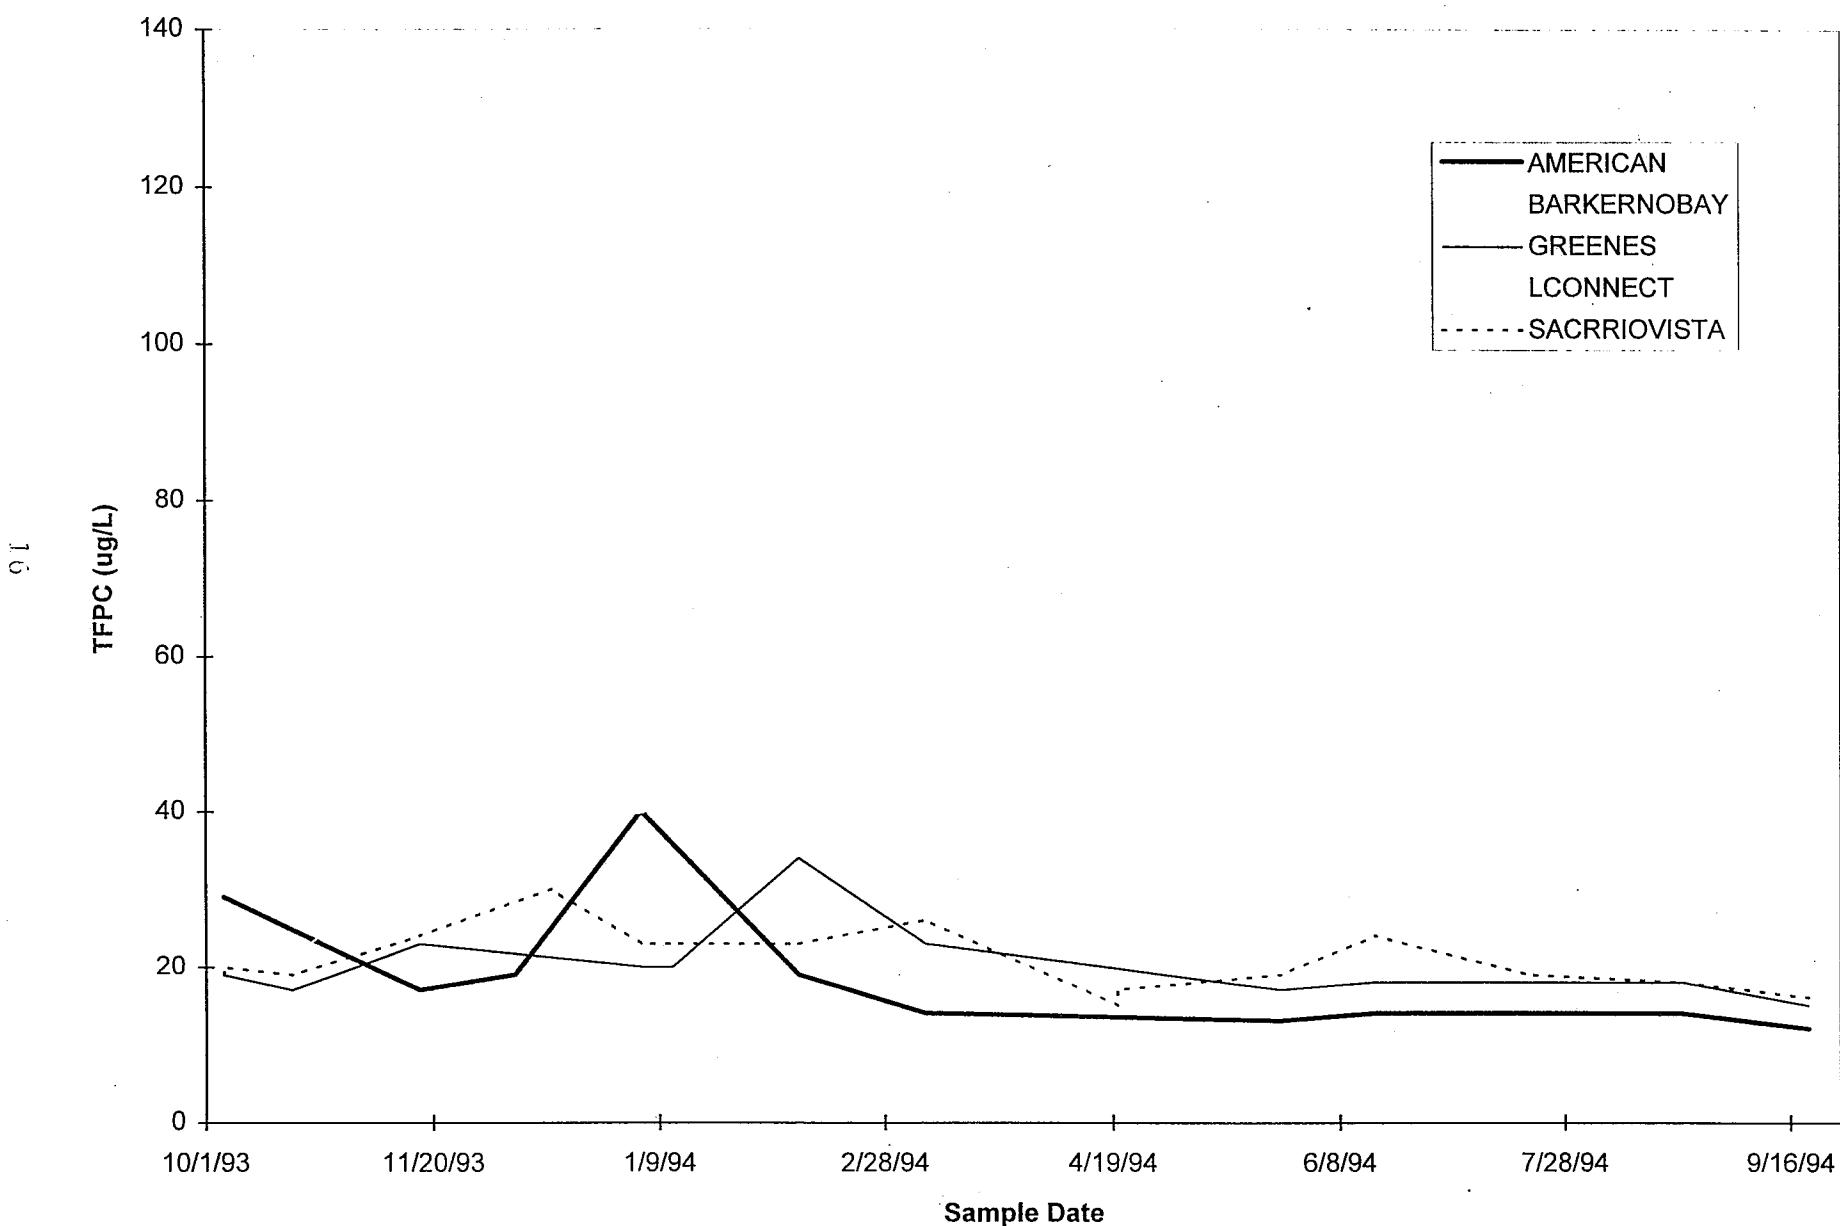

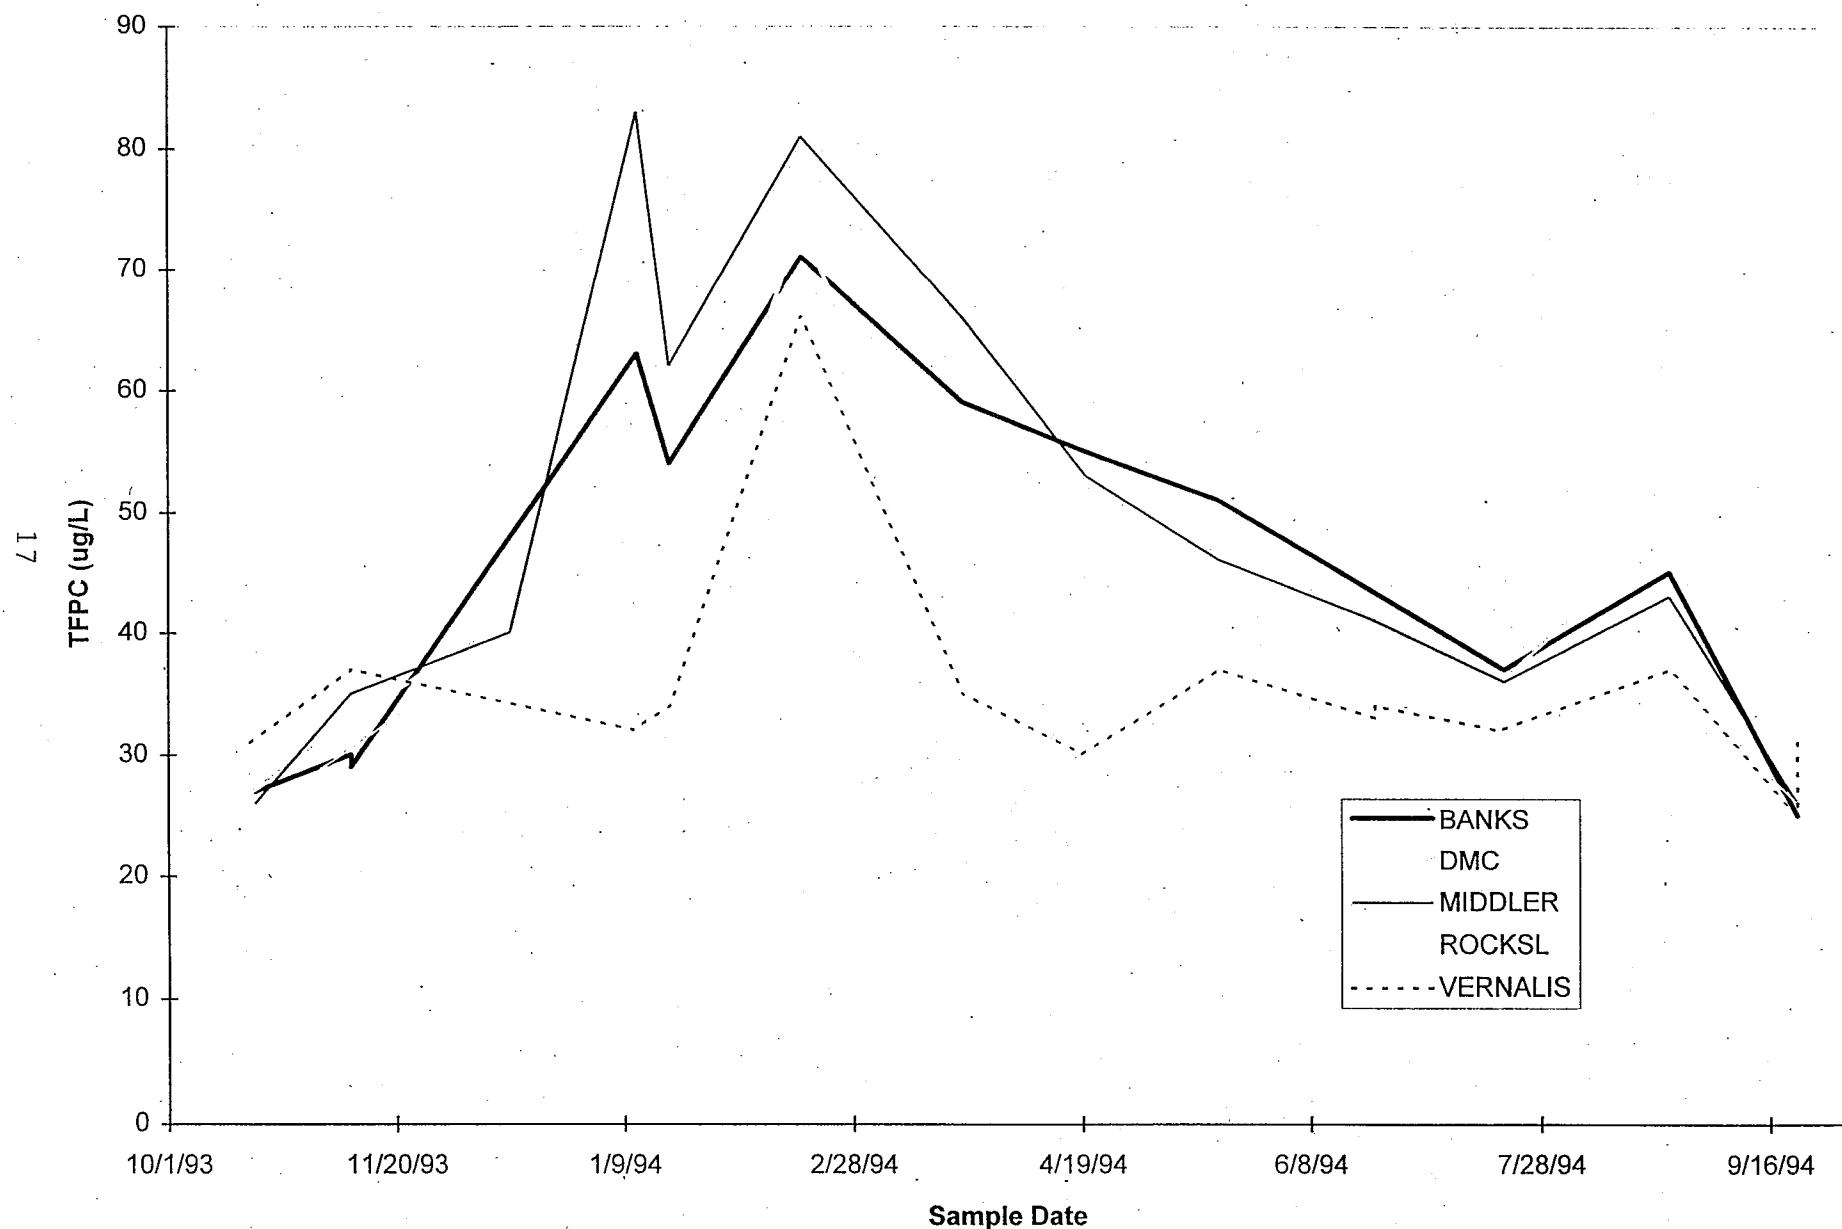

Figure 8: South Delta TFPC Ranges (10/93-9/94)

2. Minerals

Specific Conductance

The EC measurements at major channel stations are shown in Figures 9 and 10. EC fluctuated greatly depending on the station with the specific conductance for Barker North Bay pumping plant being the highest (233-494 microsiemens per centimeter). EC readings at the American River at the Water Treatment Plant intake were lowest at 50 microsiemens per centimeter. The fluctuating readings at Sacramento River at Rio Vista are a result of tidal influence at this station. The high readings at the North Bay Aqueduct pumping plant at Barker Slough in the spring and early summer months are probably a result of local agricultural drainage. The low specific conductance at the American River station shows no influence from bay tides.

In the South Delta, EC ranges shown in Figure 10 were higher than those in the North Delta, varying from 269 to 1000 microsiemens per centimeter. The EC readings at Harvey O. Banks pumping plant are less variable than the Delta-Mendota Canal because of the Clifton Court forebay operations. At the Delta-Mendota Canal, water is pumped continuously at the Tracy pumping plant regardless of tidal stage. The highest reading was at the San Joaquin River near Vernalis (at 1000 microsiemens per centimeter) which probably reflected upstream drainage discharges. The periodic high readings at the Delta-Mendota Canal result from seawater and San Joaquin River water entering the southern Delta.

Bromide

Figure 11 shows bromide ranges at North Delta channel stations. Bromide concentrations were highest at the Sacramento River at Rio Vista (0.01 to 0.12 mg/l) showing significant variation due to tidal influence. Bromide concentrations at Sacramento River at Greenes Landing, Little Connection Slough at Empire Tract, and the North Bay Aqueduct at Barker Slough ranged from below the reporting limit (currently 0.91 mg/l) to 0.10 mg/l. The bromide values at American River Treatment Plant remained at below the reporting limit throughout the year.

South Delta bromide ranges are shown in Figure 12. The patterns in bromide concentrations are similar to those seen in EC in the South Delta. There was a peak in bromide concentrations for all stations in September 1994. The highest peak in bromide concentration was at Rock Slough (0.74 mg/l) reflecting significant seawater intrusion during the dry months of 1994.

Figure 9: North Delta EC Ranges (10/93 to 9/94)

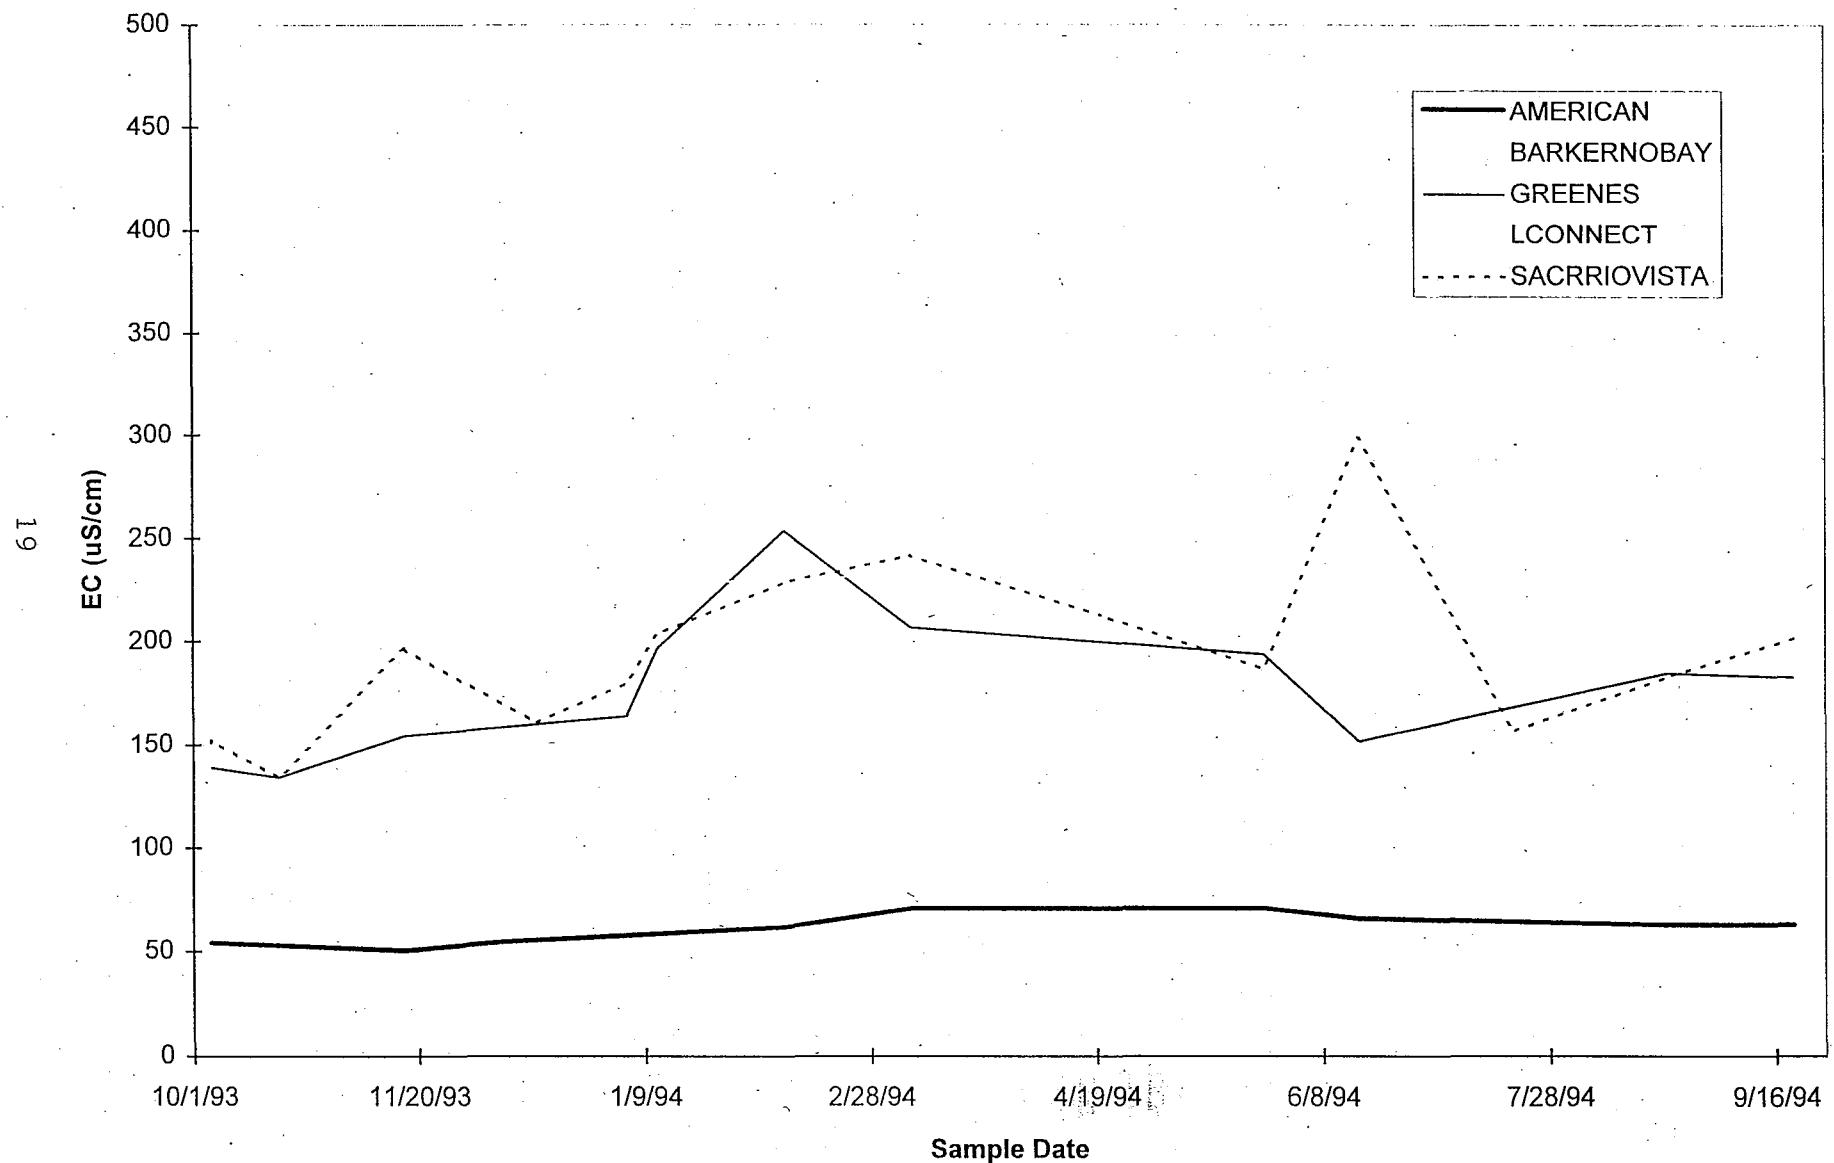

Figure 10: South Delta EC Ranges (10/93-9/94)

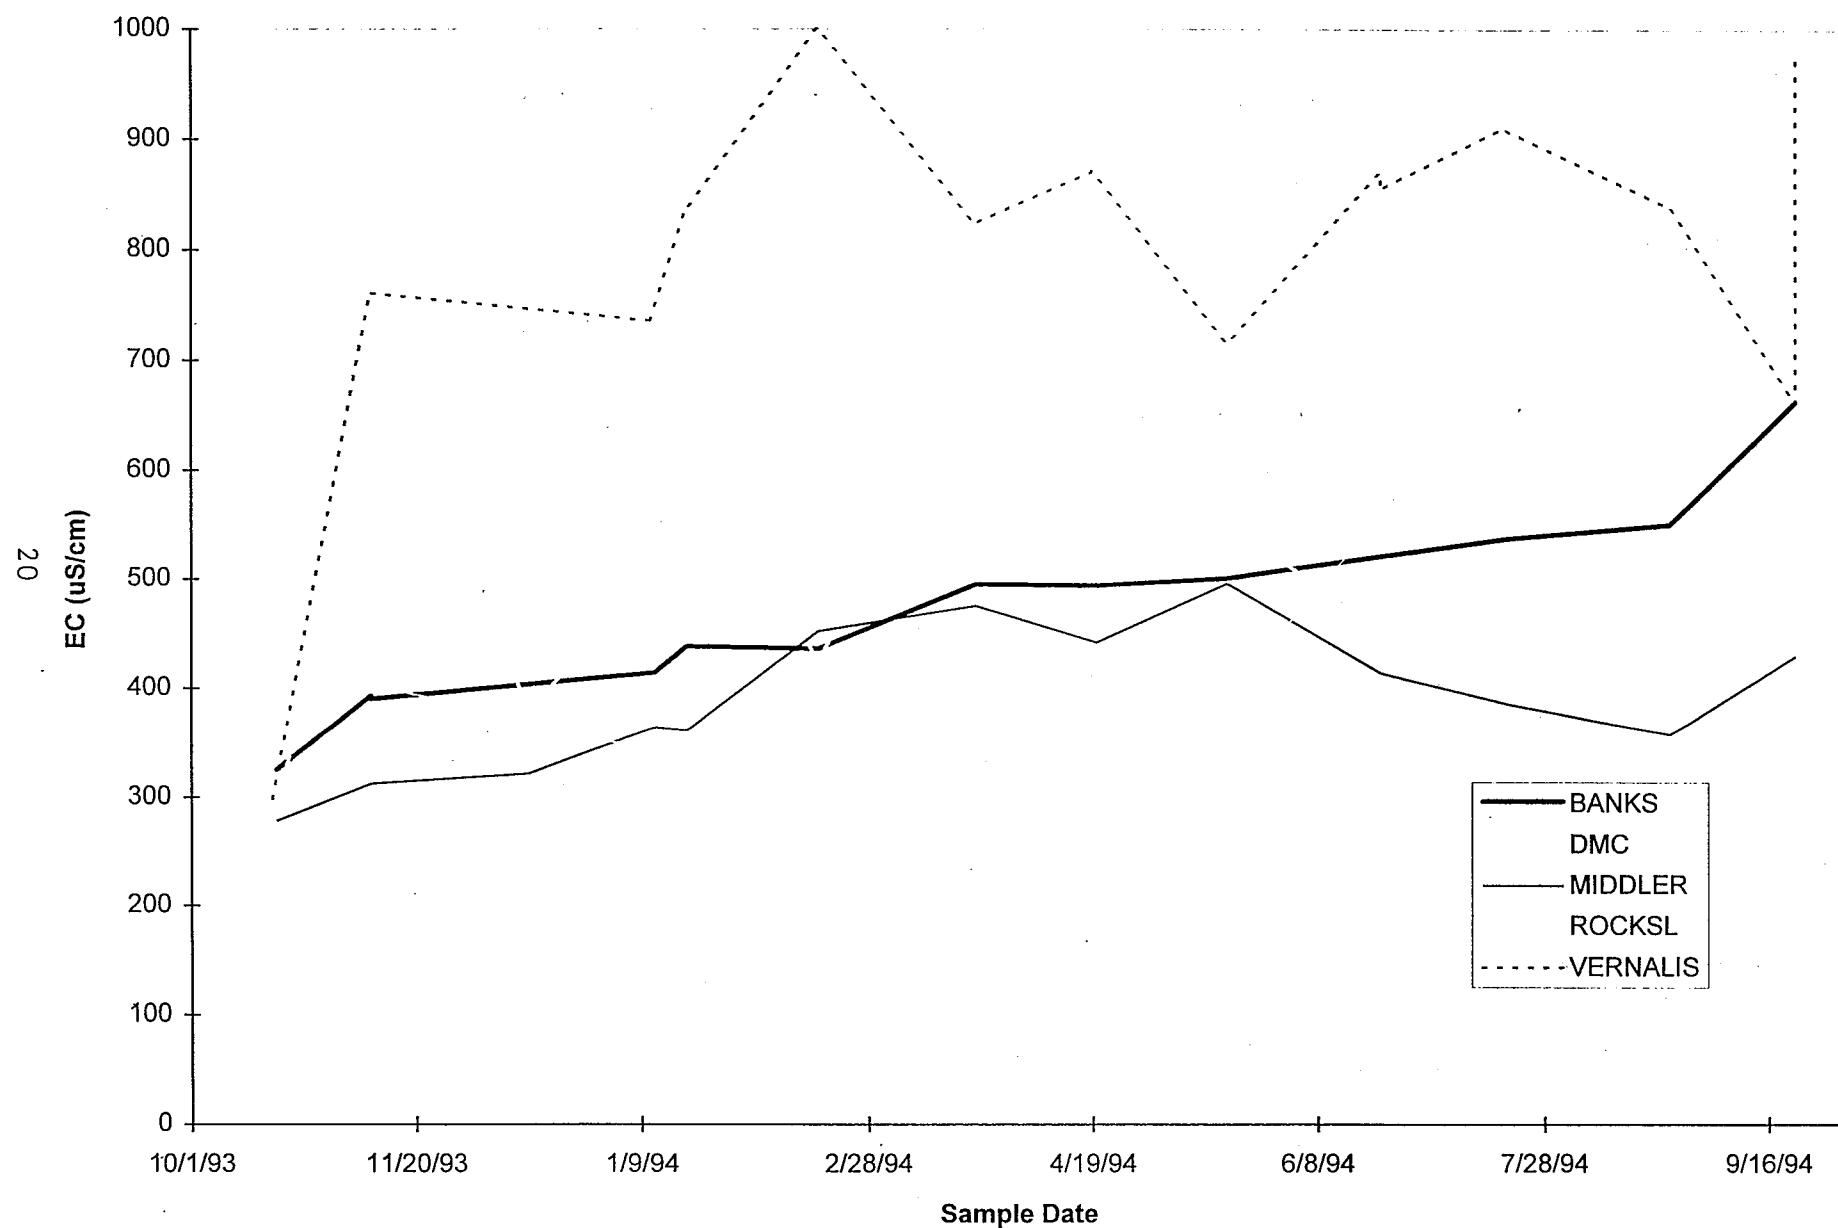

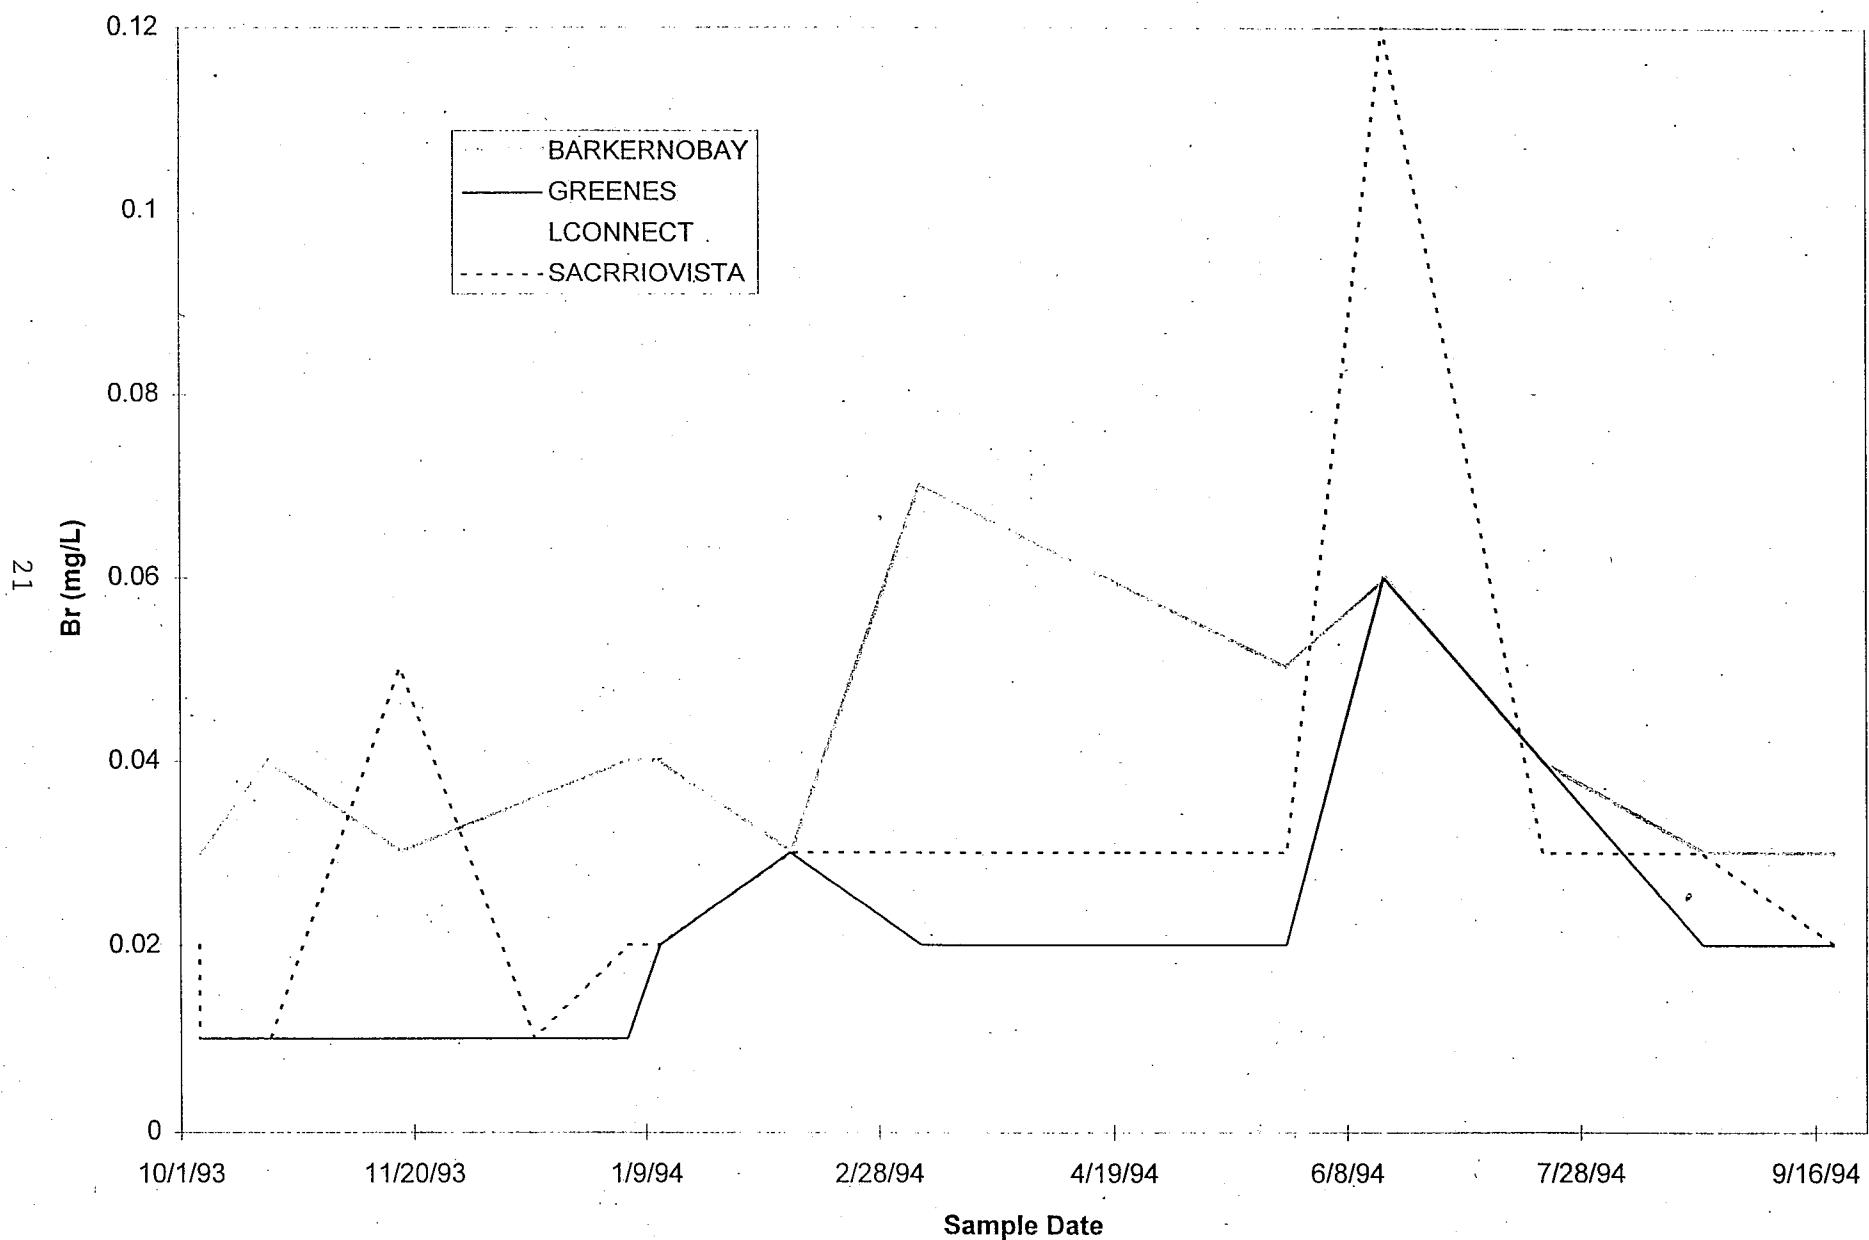

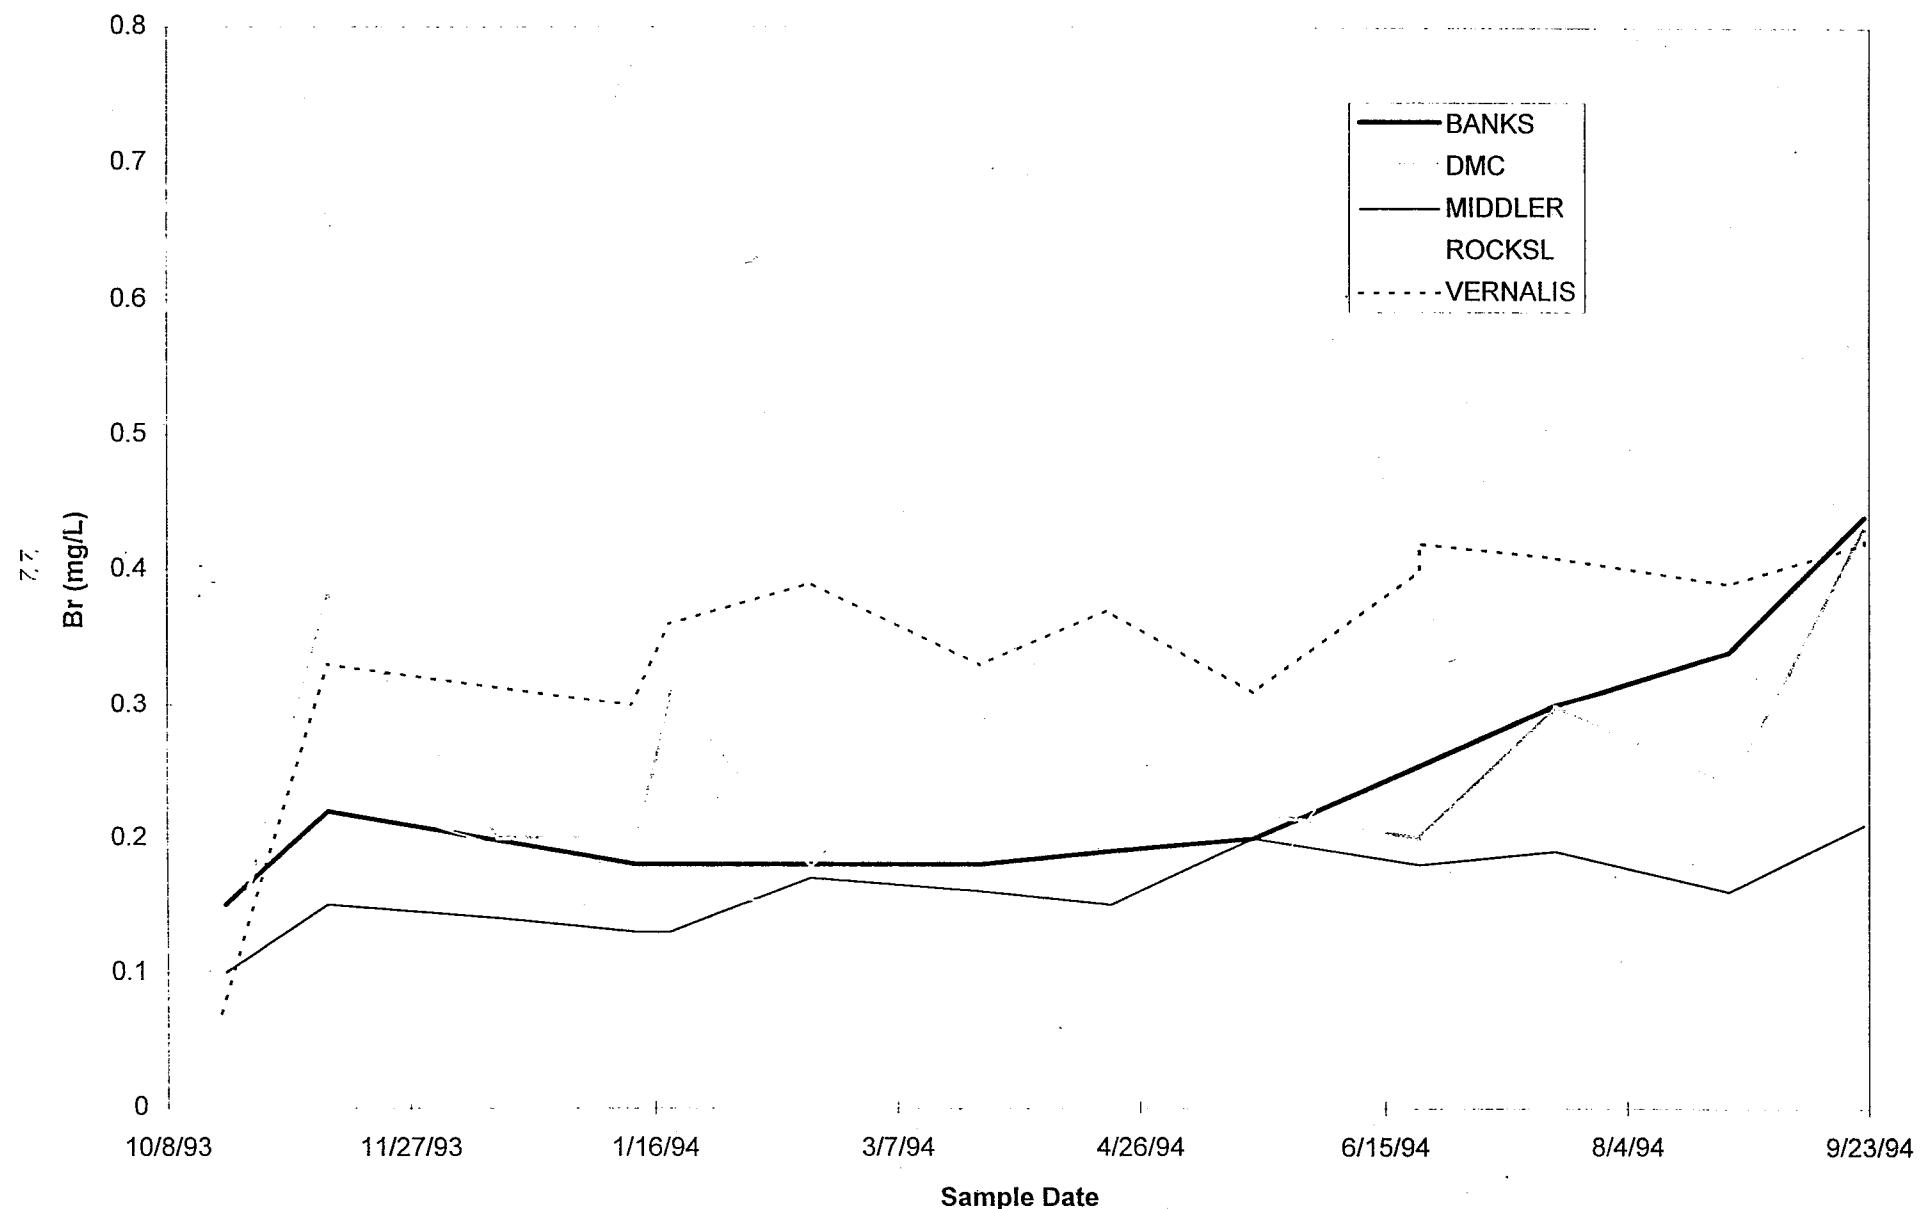

Figure 11: North Delta Bromide Ranges (10/93-9/94)

Br concentrations for American not shown. Br concentrations remained constant at <0.01 mg/L throughout the entire study period.

Figure 12: South Delta Bromide Ranges (10/93-9/94)

3. Metals

Copper and arsenic were analyzed at major channel stations. Copper analyses were consistently below the reporting limit (0.005 mg/l), with the exception being at Sacramento River, West Sacramento Intake station. At this station, copper was found at 0.011 mg/l on two dates, 6/16/94 and 7/19/94. The secondary maximum contaminant level for copper is 250 mg/l.

Arsenic was detected at some stations at low concentrations. For example, arsenic was detected at Banks pumping plant, Barker North Bay pumping plant, and Vernalis at a concentration of 0.003 mg/l, and at Greenes Landing at concentrations ranging from below the reporting limit of 0.001 mg/l to 0.002 mg/l. The current maximum contaminant level for arsenic is 0.050 mg/l.

B. Agricultural Drains

1. Organic Constituents

A comprehensive analysis of temporal and spatial patterns in DOC, TFPC, THM and UVA_{254 nm} was presented in the MWQI Five-Year Report 1987-1991. Patterns seen in Water Year 1994 followed those seen in earlier years. Figure 4.1 in the MWQI Five-Year Report 1987-1991 shows the different soil types in the Delta. According to this figure, soils are classified as either mineral, intermediate organic, or peaty.

Dissolved Organic Carbon

DOC concentrations for all agricultural drains sampled (see Figure 2) are shown in Figure 13. DOC concentrations ranged from 3.2 mg/l at the agricultural drain on Pescadero Tract pumping plant No. 1, to about 68.9 mg/l at an agricultural drain on Bouldin Island, pumping plant No. 1. The soil type on Pescadero Tract is classified as mineral, whereas the soil type on Bouldin Island is peaty.

In Figure 13, DOC concentrations were lowest in June through August and greatest in January. The January peak is likely due to rain and winter leaching.

Trihalomethane Formation Potential

During 1994, the THMFP ranged from 420 ug/l at the agricultural drain on Pescadero Tract, pumping plant No. 2 to 6300 ug/l at the agricultural drain on Bouldin Island, pumping plant No. 2 (see Figure 14).

Trihalomethane Formation Potential as Carbon

The TFPC values range from 33 ug/l at the agricultural drain on Pescadero Tract, pumping plant No. 1 to 620 ug/l at the agricultural drain on Jersey Island, pumping plant No. 1 (see Figure 15). The soil classified as mineral at Jersey Island pumping plant No. 1.

2. Mineral

Specific Conductance

Figure 16 shows EC ranges measured in the agricultural drains. EC values were mostly less than 3000 microsiemens per centimeter with occasional high values of 4000-6400 microsiemens per centimeter with the highest value at the agricultural drain at Clifton Court Forebay. Water draining into the Forebay are high in mineral salts because of mineral hot springs located upstream near Byron. The highest EC value occurred in January.

Summary of Agricultural Drain Results

The lowest values for DOC, THMFP and TFPC of the agricultural drains sampled occurred at Pescadero Tract, pumping plants No. 1 and 2, an area characterized as having mineral soils. The highest values for DOC, THMFP, and TFPC were seen at Bouldin Island, pumping plants No. 1 and 2, and at the Jersey Island pumping plant No. 1, areas characterized as having peaty and mineral soils, respectively.

The geographic variations in specific conductance (EC) are most likely resulting from tidal influence and irrigation water quality rather than soil type on the islands.

Figure 13: Agricultural Drain DOC Ranges (10/93-9/94)

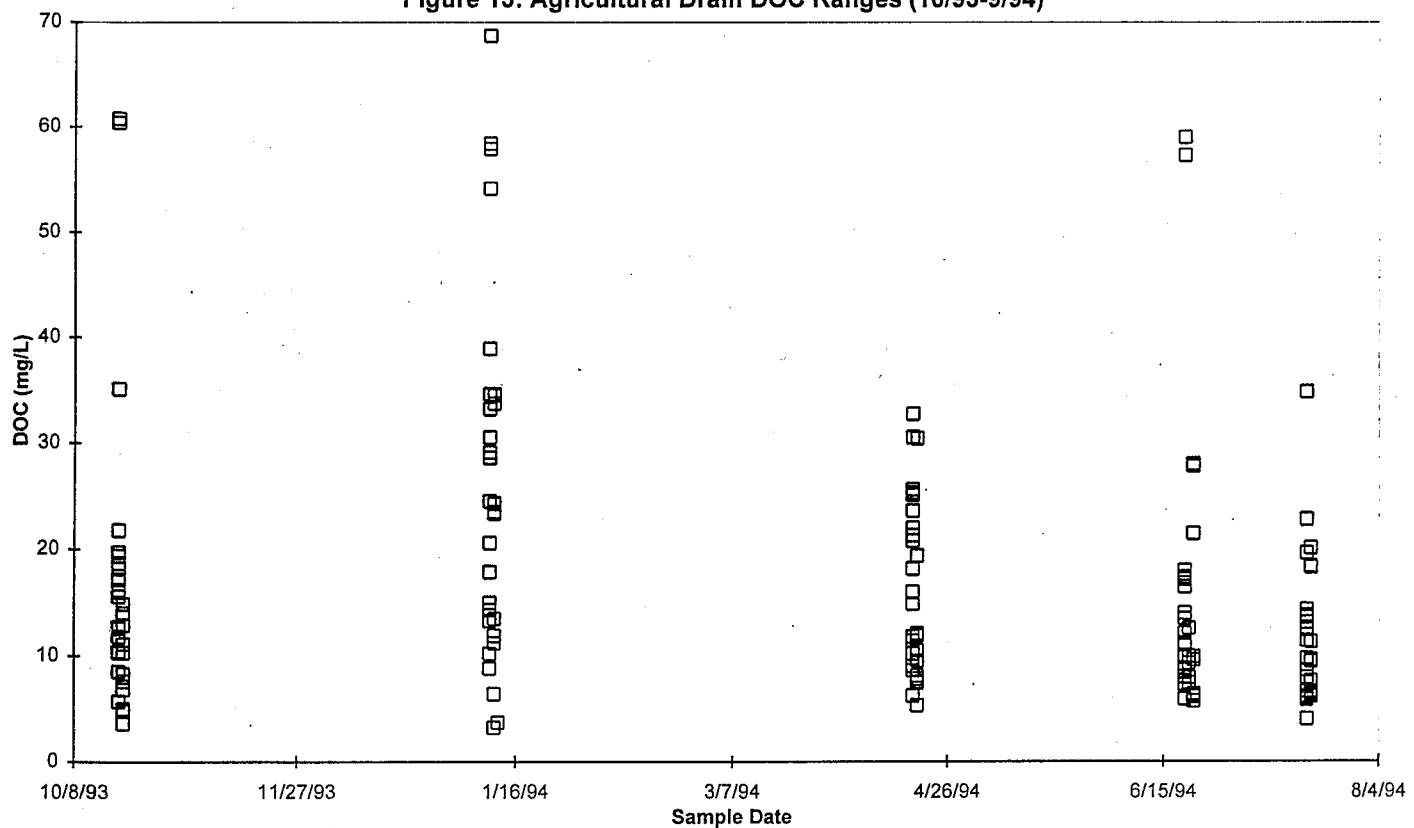

Figure 14: Agricultural Drain THMFP Ranges (10/93-9/94)

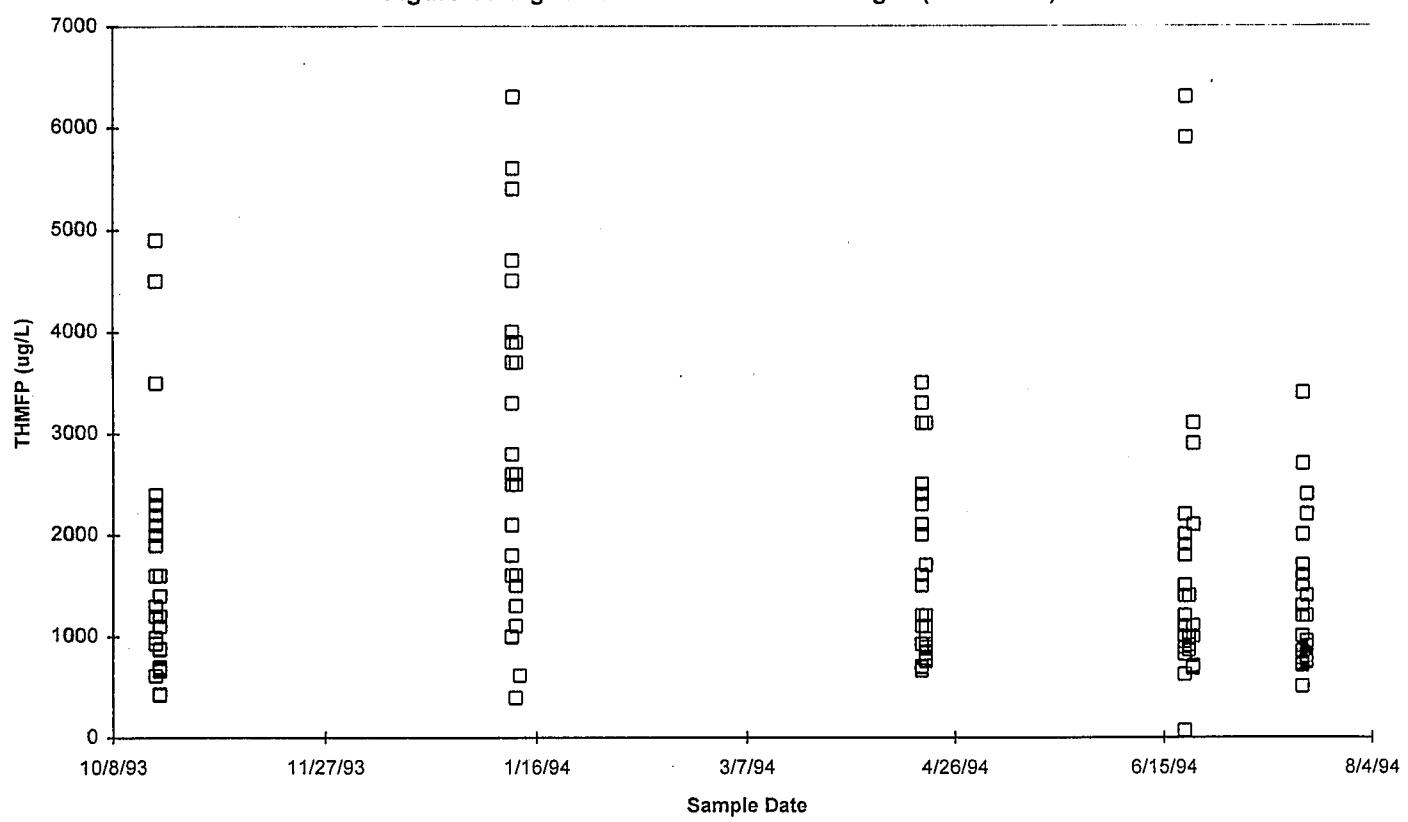

Figure 15: Agricultural Drain TFPC Ranges (10/93-9/94)

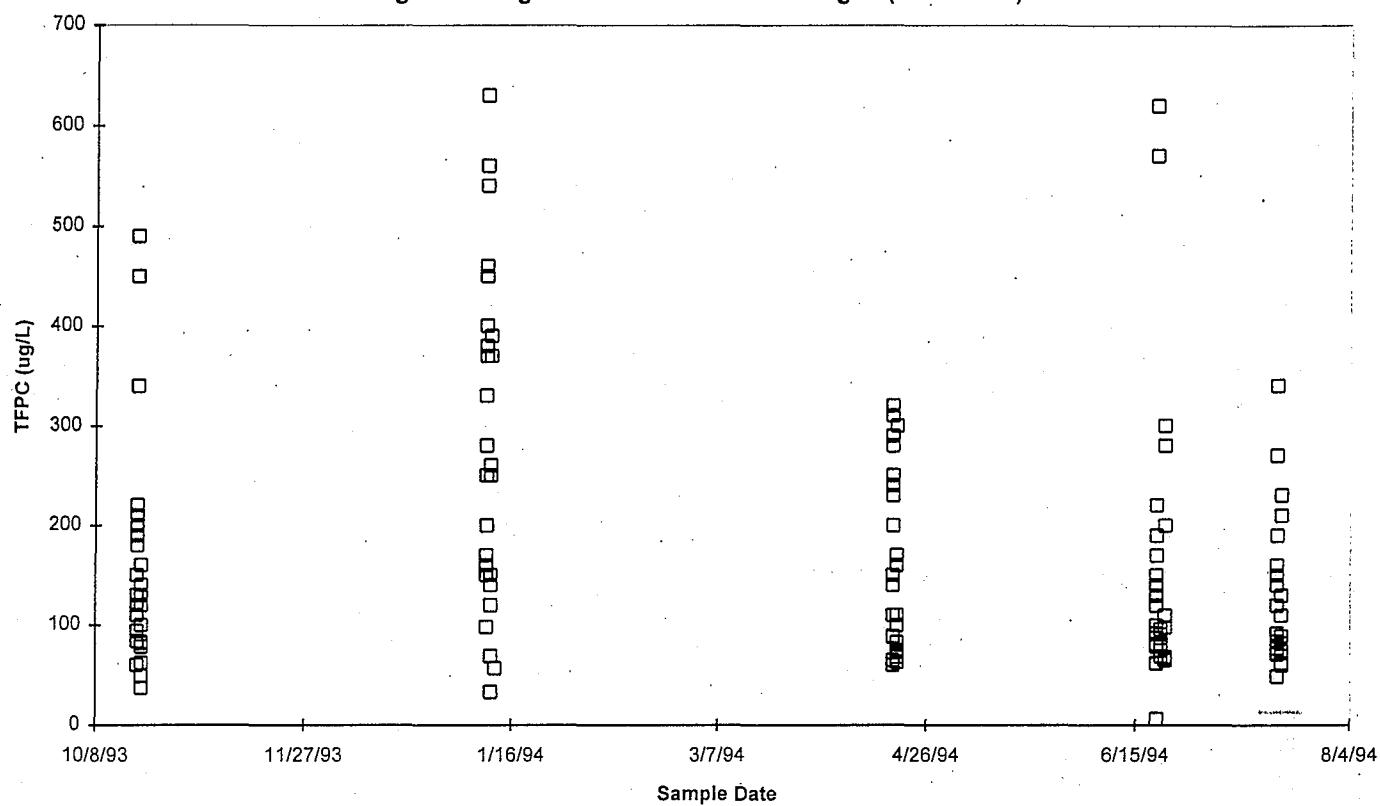

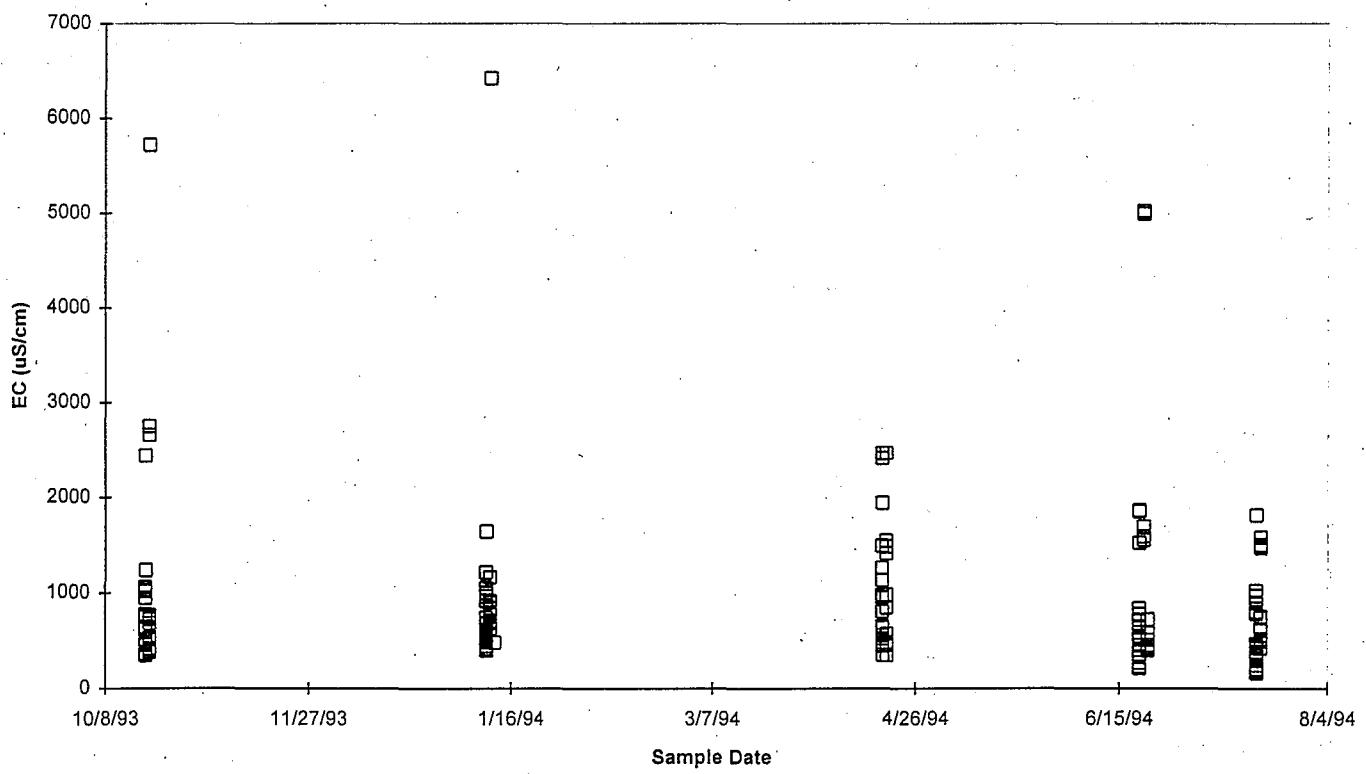

Figure 16: Agricultural Drain EC Ranges (10/93-9/94)

C. Autosamplers

1. Organic Constituents

Dissolved Organic Carbon

The results of DOC analyses at the autosampler channel stations are shown in Figure 17. At the Middle River at Borden Highway station, DOC concentrations ranged from 2.5 mg/l to 8.9 mg/l, whereas the concentrations at the Sacramento River at Greene's Landing station were from 1.4 mg/l to 7.9 mg/l.

DOC concentrations at the autosampler agricultural drain stations are also shown in Figure 17. DOC concentrations ranged from 7.7 to 64.2 mg/l at the Mandeville Island pumping plant; the range at the Twitchell Island pumping plant was from 6.7 to 42.0 mg/l.

Ultraviolet Absorbance - UVA_{254 nm}

UVA_{254 nm} measurements at the autosampler channel stations, as shown in Figure 18, ranged from a low of 0.026 to a high of 0.257 at the Middle River at Borden Highway. Sacramento at Greene's Landing ranged from a low of 0.032 to a high of 0.217.

UVA_{254 nm} measurements at the autosampler agricultural drain stations (Figure 18) had a considerably higher range than the channel stations. At the Mandeville Island pumping plant, UVA was measured with a low of 0.306 and a high of 2.680. The Twitchell Island pumping plant had a low of 0.289 and a high of 1.840.

In general, UVA_{254 nm} values are proportional to DOC concentrations. Therefore, since DOC levels are much higher in drain water than river water, UVA_{254 nm} will also behave similarly

Total THM Formation Potential Carbon

Figure 19 shows the total trihalomethane formation potential concentrations as carbon for the autosampled channel stations. The range for Middle River at Borden Highway was from 30 to 94 ug/l; the range for Sacramento River at Greene's Landing was from 16 to 48 ug/l.

TFPC for the autosampler agricultural drain stations also is shown in Figure 19. The range for the Mandeville Island pumping plant was from 100 to 530 ug/l, while the range for the Twitchell Island pumping plant was from 85 to 470 ug/l.

Figure 17: Autosampler DOC Ranges (10/93-9/94)

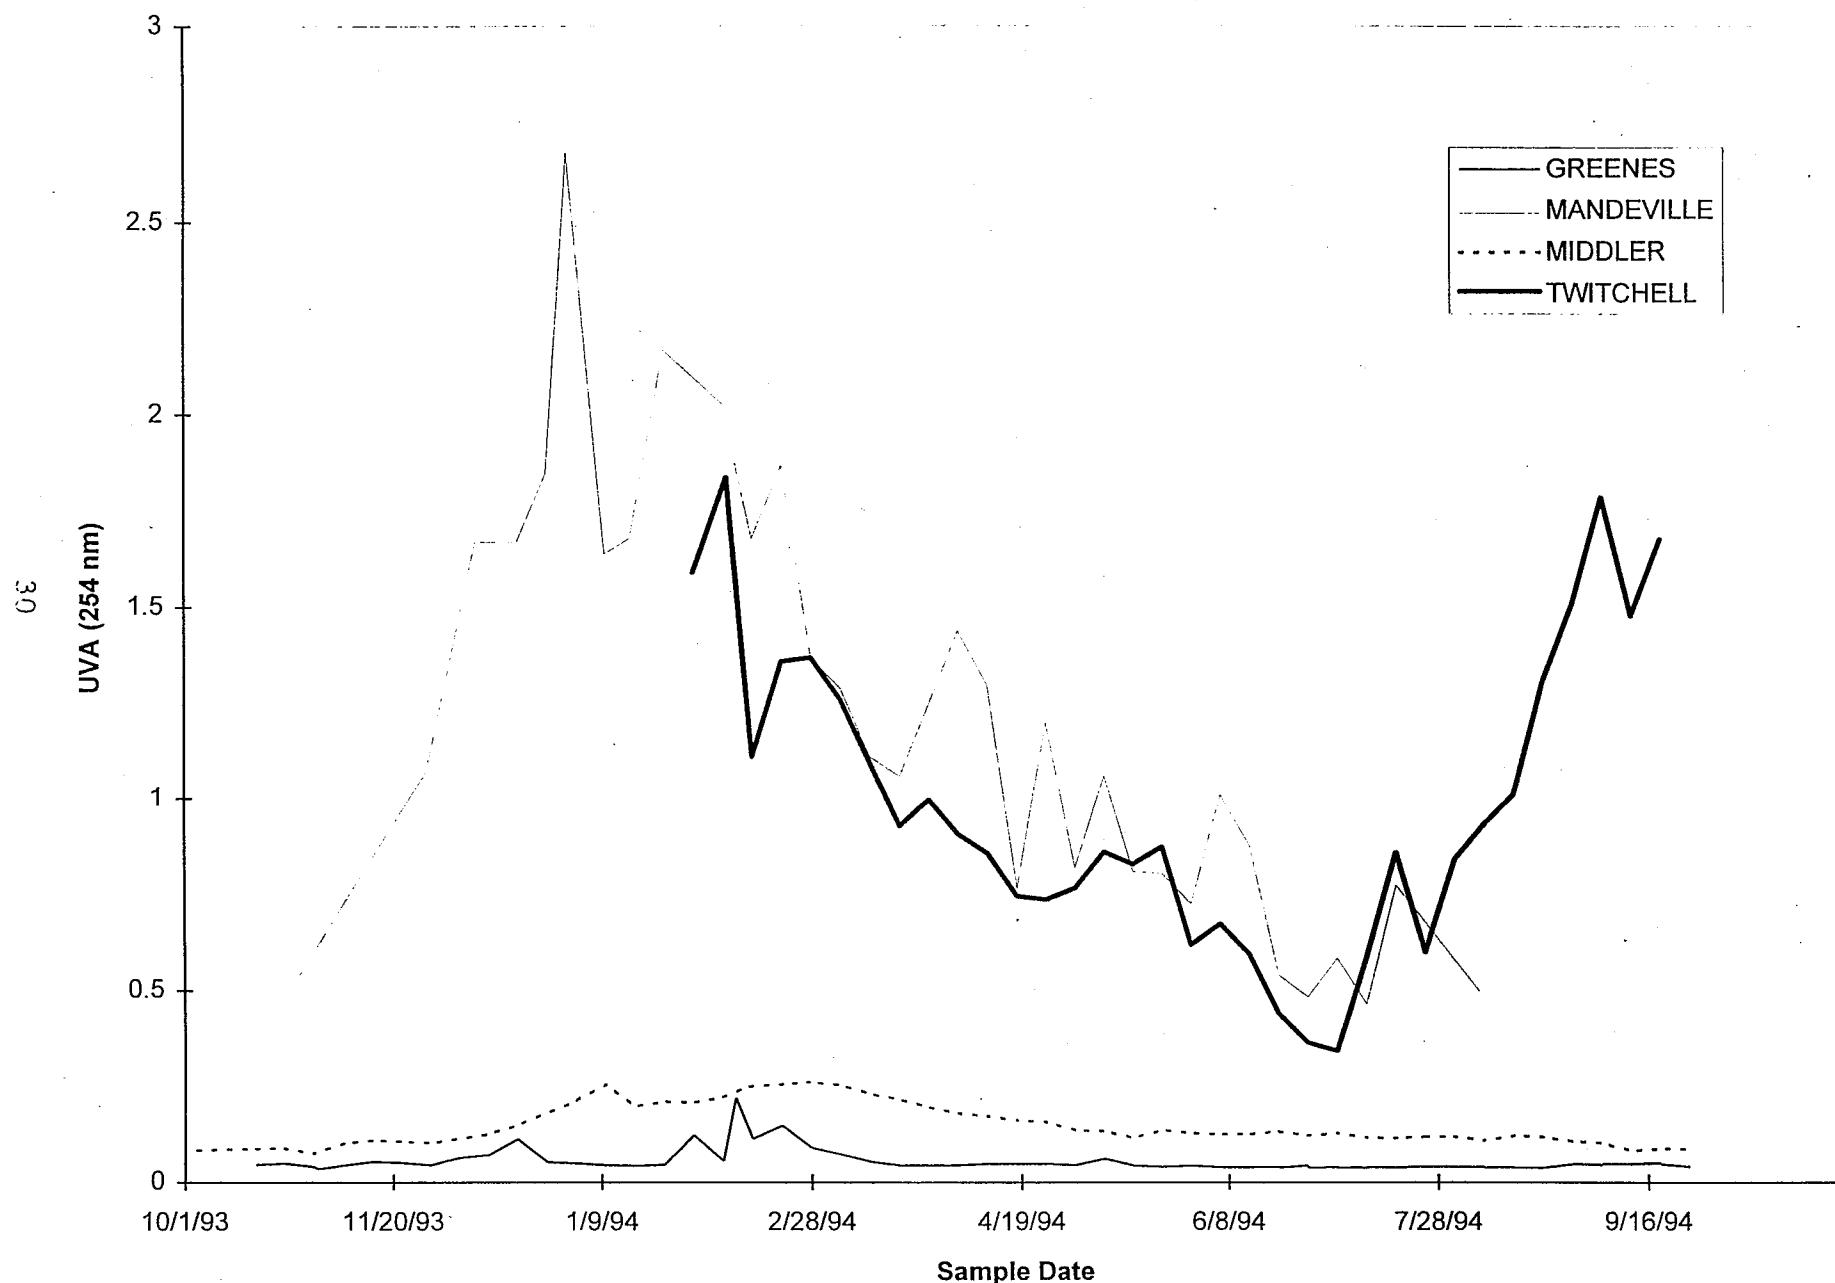

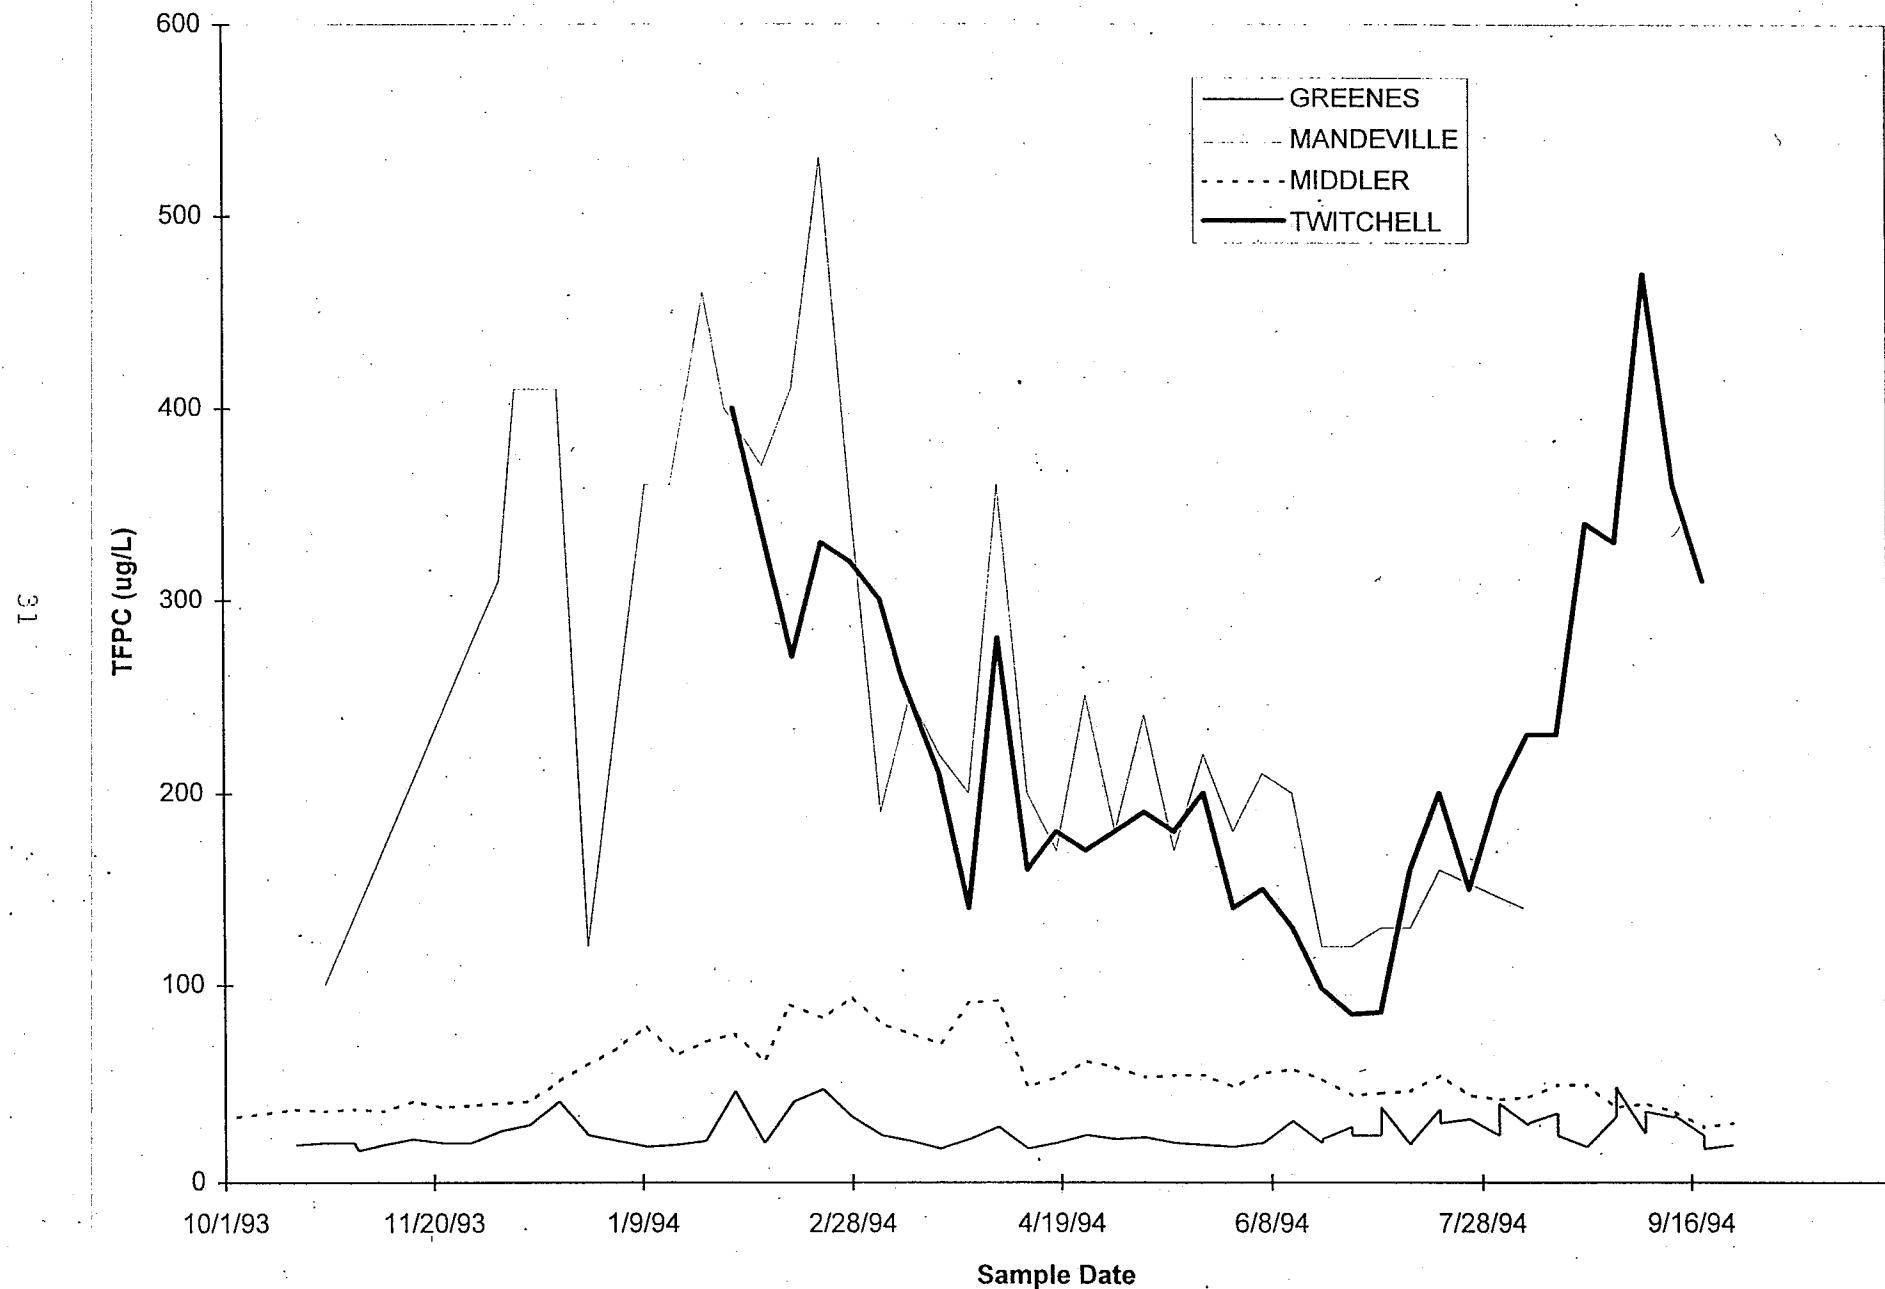

Figure 19: Autosampler TFPC Ranges (10/93-9/94)

Appendix A.
Data Quality Review

APPENDIX A. DATA QUALITY REVIEW

This data quality review covers MWQI Quality Assurance/Quality Control data from the 1994 water year (October 1993 to September 1994). The data quality review involved comparing data from the quality control samples against acceptable control limits. Data that fell outside these control limits were flagged.

Two environmental laboratories provided analyses of MWQI water samples during the 1994 water year. DWR's Bryte Chemical Laboratory analyzed water samples for minerals, minor elements and some organics. The analytical methods used are shown on Table A-8 and Table A-9. Clayton Environmental Consultants (Clayton), Pleasanton, California, performed trihalomethane formation potential (TFPC) analyses with EPA Method 502.2 which had acceptance limits of 80-120 percent (except for chlorine recoveries where Standard Method 4500-Cl-B with control limits of 75-125 percent were used).

QC data from Bryte were manually compiled to achieve at least a 20 percent random representation. The QC data from Clayton enabled a 100 percent review of the QC data reported.

The TFPC data quality review indicated Clayton had contamination problems in their method blanks in November 1993 through February 1994. The QC information provided by Clayton indicated that there was difficulty in locating an acceptable source of de-ionized (DI) water for their dilutions and method blanks. Clayton took corrective actions before analyzing the environmental samples.

The available QC data indicated that overall Bryte's mineral and minor elements analyses were of acceptable quality. The laboratory is in the process of automating their data reporting procedures to enable easier access to their QC data. The results of the data quality review are presented in more detail below.

A. Sample Holding Times

The date from when the TFPC samples were spiked to the date they were quenched was the incubation period and should not have exceeded seven days. The samples had to be analyzed within fourteen days of quenching. This 14-day period was the holding time.

1. Clayton Environmental Consultants

One hundred and forty-four samples out of five hundred and sixty environmental samples (26 percent) were reviewed (Table A-1). There were no holding time exceedances.

Table A-1: Frequency of Holding Time Exceedances for Clayton Environmental Consultants

Analyte	Holding Time (days)	No. of samples reviewed	Samples outside holding times	Frequency of Samples out of Limits (%)
Bromodichloromethane	14	144	0	0
Bromoform	14	144	0	0
Chloroform	14	144	0	0
Dibromochloromethane	14	144	0	0

2. Bryte Chemical Laboratory

Minerals

Twenty five percent of mineral data (120 out of 478 samples) were reviewed for holding times (Table A-2). There were no holding time exceedances.

Minor Elements

Thirty-five samples out of approximately one hundred and forty (25 percent) were reviewed (Table A-2). There were no holding time exceedances.

Table A-2: Frequency of Holding Time Exceedances for Bryte Chemical Laboratory

Analyte	Holding Time (days)	No. of samples reviewed	Samples outside holding times	Frequency of Exceedances (%)
Standard Minerals	180	120	0	0
Minor Elements	180	35	0	0
Bromide	14	35	0	0

B. Method Blanks

The purpose of the method blanks was to detect and quantify contamination introduced through sample preparation or analysis procedure (some 'background noise' is allowed).

1. Clayton Environmental Consultants

All the method blanks (100 percent) performed in the study period were reviewed (Table A-3). There were some contamination problems as previously described on the dates shown in Table A-4. The laboratory took corrective action before analyzing the environmental samples, resulting in the data being of acceptable quality.

Table A-3: Contamination Frequency of Clayton Environmental Consultants Method Blanks

Analyte	Acceptance Limits (μl)	Total Analyses Performed	Analyses Outside Limits	Frequency of Samples out of Limits (%)
Bromodichloromethane	5	82	8	10
Bromoform	5	82	0	0
Chloroform	20	82	10	12
Dibromochloromethane	5	82	0	0

Table A-4: Method Blank Contamination Dates for Clayton Environmental Consultants

Analyte	Acceptance Limits (μl)	Method Blank Recovery (μl)*	Sample Date	Analysis Date
Bromodichloromethane	5	18,20	5/24/94	8/2/94
Bromodichloromethane	5	15	6/13/94	8/3/94
Bromodichloromethane	5	20	6/24/94	8/3/94
Bromodichloromethane	5	31, 30, 33, 34	1/12/94	2/28/94
Chloroform	20	25	10/19/93	11/8/93
Chloroform	20	32, 31, 33, 30	10/18/93	11/15/93
Chloroform	20	66, 71	6/24/94	8/2/94
Chloroform	20	29	12/15/93	1/7/94
Chloroform	20	58	6/3/94	8/3/94
Chloroform	20	34	12/20/93	1/7/94

* Only method blank recoveries that were outside the control limits are shown.

2. Bryte Chemical Laboratory

According to laboratory personnel, method blank analyses were performed and corrective actions were taken when contamination problems were detected. When method blanks showed contamination, it was Bryte's procedure to halt the environmental samples analyses until the method blank corrective actions were instituted. Although Bryte had no method blank records, its system for corrective actions resulted in no contamination from instrument or operator error. The process of recording and reporting method blanks will be instituted with the new laboratory data management system being developed.

C. Field Blanks

1. Clayton Environmental Consultants

Field blank samples were not collected for TFPCs.

2. Bryte Chemical Laboratory

Field blanks were used to monitor contamination originating from the collection, transportation and storage of environment samples. Laboratory prepared blank water was supplied to the field personnel who processed it in the same manner as environmental samples--including filtration. The data in Table A-5 are for the filtered field blanks. All of the 58 filtered blanks analyses performed were reviewed, and none was contaminated indicating acceptable field operating procedures.

Table A-5: Filtered Field Blank Contamination Results for Bryte Chemical Laboratory

Analyte	No. of samples reviewed	Samples outside limits	Frequency of Exceedances (%)
Standard Mineral	58	0	0
Minor Element	58	0	0

Laboratory prepared blank water was taken to the field and processed in the normal manner except it was not taken through the filtration process. These unfiltered field blanks were used to monitor cross-contamination from containers and preservative (Table A-6). There was no indication of cross-contamination.

Table A-6: Unfiltered Field Blank Contamination Results for Bryte Chemical Laboratory

Analyte	No. of samples reviewed	Samples outside limits	Frequency of Exceedances (%)
Standard Mineral	58	0	0
Minor Element	58	0	0

D. Matrix Spike Recoveries

Matrix spike recoveries indicate the accuracy of recovering a known concentration of substance in the matrix. The results of a matrix spike indicate the accuracy of recovery given the interference peculiar to any given matrix. The percent recovery must fall within acceptable limits.

1. Clayton Environmental Consultants

All the matrix spikes recoveries reported by Clayton (100 percent) were reviewed, (Table A-7). One bromodichloromethane spike and one dibromochloromethane spike were lower than the control limits (77 percent and 74 percent respectively). Ninety-nine percent of the recoveries were within the acceptable control limits. This indicated that good accuracy was obtained for the environmental samples and that interference from the matrix was unlikely.

Table A-7: Matrix Spike Recovery for Clayton Environmental Consultants

Analyte	Method Control Limit (%)	Total Analyses Performed	Analyses Outside Limits	Frequency of Samples out of Limits (%)
Bromodichloromethane	80-120	81	1	1
Bromoform	80-120	81	0	0
Chloroform	80-120	81	0	0
Dibromochloromethane	80-120	81	1	1

2. Bryte Chemical Laboratory

Minerals

Twenty-five percent of the standard mineral QC matrix spike recoveries were reviewed. All the parameters measured were all within the control limits.

Table A-8: Standard Mineral Matrix Spike Recovery for Bryte Chemical Laboratory

Analyte	Method Control Limits (%)	Method (EPA)*	Total Analyses Reviewed	Analyses Outside Limits	Frequency of Samples out of Limits (%)
Na	82-116	273.1	45	0	0
Cl	89-114	325.2	98	0	0
Se	74-121	270.3	28	0	0
Ca	84-117	215.1	51	0	0
Mg	86-113	242.1	58	0	0
K	80-120	258.1	59	0	0
ALK	88-111	310.1	42	0	0
SO ₄	82-120	375.2	99	0	0
B	92-111	USGS 1-2115-85	96	0	0
Br	82-118	300.0	48	0	0

Minor Elements

Twenty-five percent (30 out of about 120) of the minor element QC matrix spike recoveries were reviewed (Table A-9). All were within the acceptable control limit.

Table A-9: Minor Element Matrix Spike Recovery for Bryte Laboratory

Analyte	Method Control Limits (%)	Method (EPA)*	Total Analyses Reviewed	Analyses Outside Limits	Frequency of Samples out of Limits (%)
As	77-121	260.3	18	0	0
Fe	82-119	236.2	14	0	0
Cr	86-122	218.5	6	0	0
Cu	80-116	220.2	25	0	0

E. Matrix Spike Duplicate Recoveries

Matrix spike duplicate results indicate the precision of the analytical method in a given matrix. The difference between the duplicate samples is reported as a relative percent difference (RPD). This difference is compared against the individual laboratory control limit as a conservative approach to determining precision.

1. Clayton Environmental Consultants

All of the matrix spike duplicates reported by Clayton during the study period were reviewed (Table A-10). All were within the acceptable control limits.

Table A-10: Matrix Spike Duplicate Recovery for Clayton Environmental Consultants

Analyte	Acceptable RPD's (%)*	Total Analyses Performed	Analyses Outside Limits	Frequency of Samples out of Limits (%)
Bromodichloromethane	20	81	0	0
Bromoform	20	81	0	0
Chloroform	20	81	0	0
Dibromochloromethane	20	81	0	0
Chlorine	20	64	0	0

*RPD: Relative Percent Difference

2. Bryte Chemical Laboratory

Bryte Laboratory was in the process of revising their reporting procedures. As a result, no data were available.

F. Laboratory Control Samples

Laboratory control samples (LCS) recoveries were used to assess the accuracy of the analytical method. A known concentration of analyte was spiked into a clean medium and then analyzed. The results were compared to the laboratories' control limits.

1. Clayton Laboratory

Laboratory control samples (LCS) recoveries were used to assess the accuracy of the analytical method. A known concentration of the analyte was spiked into a clean medium (DI water) and then analyzed. The results were compared to the laboratory's control limits. All of the eighty-one LCS analyses reported by Clayton were reviewed. All were within the acceptable control limits (Table A-11) indicating good TFPC recoveries.

Table A-11: Laboratory Control Sample Recovery for Clayton Laboratory

Analyte	Method Control Limit (%)	Total Analyses Performed	Analyses Outside Limits	Frequency of Samples out of Limits (%)
Bromodichloromethane	80-120	81	0	0
Bromoform	80-120	81	0	0
Chloroform	80-120	81	0	0
Dibromochloromethane	80-120	81	0	0

2. Bryte Chemical Laboratory

Minerals

Approximately 30 percent of mineral QC batches were reviewed (Table A-12). All of the LCS recoveries were within the acceptable control limits indicating good recovery for minerals.

Table A-12: Standard Mineral LCS Recovery for Bryte Chemical Laboratory

Analyte	Method Control Limits (%)	Total Analyses Reviewed	Analyses Outside Limits	Frequency of Samples out of Limits (%)
Na	85-115	28	0	0
Cl	85-115	46	0	0
Se	80-120	15	0	0
Ca	85-115	37	0	0
Mg	85-115	40	0	0
K	85-115	31	0	0
ALK	85-115	39	0	0
SO4	85-115	47	0	0
TOC	85-115	51	0	0

Minor Elements

Approximately 30 percent of minor elements QC analyses were reviewed, Table A-13. (Note: not all analytes were analyzed for in every QC batch). They were all within the acceptable recovery limits indicating good recovery for minor elements.

Table A-13: Minor Element LCS Recovery for Bryte Chemical Laboratory

Analyte	Method Control Limits (%)	Total Analyses Reviewed	Analyses Outside Limits	Frequency of Samples out of Limits (%)
As	80-120	20	2	10
Fe	85-115	2	0	0
Cr	85-115	2	0	0
Cu	85-115	6	0	0
